It is widely diffused through the tropics, native at least in South America and naturalized in the southern United States. The name is extended to other sensitive mimosas, as *M. sensitiva*, which is irritable in a less degree, and sometimes to the whole genus.—**Bastard sensitive-plant,** *Eschynomene Americana*. Inasmuch as religion and law and the whole social order of civilized society, to say nothing of literature and art, are so founded on *sentiment* that they would all go to pieces without it, it is a word not to be used too lightly in passing judgment, as if it were an element to be thrown out or treated with small consideration.

Another form of separator uses graduated screens, either flat or cylindrical, the cylindrical screens being made to revolve as the grain passes through them, and the flat screens having often a reciprocating motion to shake the dust out as the grain is passed over the screen. A recent form of separator employs cylinders of dented sheet-metal, the good grain being caught in the indentations and carried away from the chaff, which slips past the cup-like depressions. In still another form, the grain slides down a revolving cone, the round weed-seeds fly off by centrifugal force, while the grain slides into a spout provided to receive it. A variety of screens for sorting fruit and roots according to sizes are also called *separators*: as, a potato-separator. The vessel is filled with the mixture, and left at rest till the liquids separate mechanically, when the fluids can be drawn off by the cocks at their respective levels, or (in the form here figured) the denser liquid may be first drawn off completely through the stop-cock at the bottom, the narrow neck allowing the separation to be almost exactly performed. (d) A name given to various modern and more or less complicated forms of apparatus used for dressing ore.—**Chop separator**, in milling, a machine for separating the flour from quantities of cracked grain as the meal comes from the roller-mill. A period of seventy days.—2. [*cap.*] The third Sunday before Lent: more fully called *Septuagesima Sunday*. The original history of this name and of *Sexagesima* (applied to the Sunday following) is not known; and any direct reference to sixty and seventy in these periods of sixty-three and fifty-six days before Easter is not to be traced. The probability is that the use of *Quinquagesima Sunday* for the first Sunday in *Quadragesima* or Lent, and the independent use of *Quinquagesima* for the fiftieth day before Easter (both included), led to the extension of the series by the inexact application of the names *Sexagesima* and *Septuagesima* to the two Sundays preceding. Also called *Lost Sunday*, *Albino Sunday*, *See Sunday*.

1. *n.* 1st. The Seventy—that is, the seventy (or more) persons who, according to the tradition, made a translation of the Hebrew Scriptures into Greek. The rounded legend is that the translation was made by seventy-two persons in seventy-two days. In another view, the Seventy were members of the sanhedrim (about seventy in number) who sanctioned the translation.

The *Septuagints* translation.

Minshew.

2. A Greek version of the Hebrew Scriptures made by the Seventy (see *def.* 1): usually expressed by the symbol LXX ('the Seventy'). This version is said by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, King of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually; but the translation is believed to have been completed by the second century B. C. The Septuagint is written in the Hellenistic (Alexandrine) dialect, and is linguistically of great importance from its effect upon the diction of the New Testament, and as the source of a large part of the religious and theological vocabulary of the Greek fathers, and (through the Old Latin version of the Bible (see *Italic*) and the influence of this on the Vulgate) of that of the Latin fathers also and of all western nations to the present day. In the Greek Church the Septuagint has been in continuous use from the earliest times, although other Greek versions (see *Hexapla*) were anciently also in circulation, and it is the Old Testament still used in that church. The Septuagint contains the books called *Apocrypha* intermingled among the other books. It is the version out of which most of the citations in the New Testament from the Old are taken. Abbreviated *Sept*.

II. *a.* Pertaining to the Septuagint; contained in the Greek copy of the Old Testament.

Septuagintal (sep'tü-a-jin'täl), *a.* [*Septuagint* + *-al*.] Pertaining or relating to the Septuagint; contained in the Septuagint.

[*NL.*, dim. of *L. septum, septum*, a partition: see *septum*.] A little septum or small partition.—*Septula renum*, inward prolongations of the cortical substance of the kidneys, extending between the pyramids as far as the sinus and bases of the papillae. Also called *columnæ Bertini* or *columns of Bertin*, and *cortical columns*.

septum (sep'tum), *n.*; pl. *septa* (-tä). [*NL.*, < *L. septum, septum*, fence, inclosure, partition, < *sæpere, seipere*, pp. *sæptus, septus*, hedge in, inclose, < *sæpes, sepes*, a hedge, a fence.] A partition; a wall separating two cavities.

It is found upon experiment that hydrogen goes through a septum or wall of graphite four times as fast as oxygen. *W. K. Clifford, Lectures*, I. 205.

Specifically—(a) In *bot.*, any kind of a partition, whether a proper dissepiment or not: as, the *septum* in a seed; the *septum* of a spore. (b) In *anat.* and *zool.*, a partition; a wall between two cavities, or a structure which divides a part or an organ into separate portions; a dissepiment. In vertebrates the formations known as *septa* are most frequently situated in the vertical longitudinal median line of the body, but may be transverse or otherwise disposed. A number of them are specified by qualifying words. See phrases following. (c) In *corals*, a calcified mesentery; one of the six or more vertical plates which converge from the wall to the axis of the visceral space, dividing this into a number of radiating loculi or compartments. Each septum appears single or simple, but is really a duplicate of closely apposed plates, just as the mesentery itself is a fold. They are to be distinguished from the horizontal dissepiments, or tabulae, which may cut them at right angles. They are variously modified in details of form, may be connected by synapticle, and are divided, according to their formation, into *primary*, *secondary*, and *tertiary*. (d) In *couch*, one of the transverse partitions which separate the cavity of the shell of a cephalopod into chambers. (e) In *Fernex*, a sort of diaphragm, a series of which

may partition a worm into several cavities. (f) In *Protozoa*, the wall between any two compartments of the test, as of a foraminifer.—**Branchial, crural, intermuscular, nasal, pectiniform, pericardial septum**. See the adjectives.—**Septum aorticum**, the aortic or anterior segment of the mitral valve.—**Septum atrium, or septum auricularium**, the partition between the right and left auricles of the heart. It is perfect in the adults of the higher vertebrates, as mammals and birds, but in the embryo is perforated by an opening called *foramen ovale*, from its shape in man.—**Septum cerebelli**. Same as *foramen cerebelli*.—**Septum cordis**, the partition between the right and left cavities of the heart.—**Septum crurale**, a layer of condensed areolar tissue which closes the femoral ring in man, serves as a barrier to the protrusion of a femoral hernia, and is perforated for the passage of lymphatics: badly so named by J. Cloquet, and better called *septum femorale*.—**Septum femorale**, the septum crurale. *H. Gray, Anat.* (ed. 1888).—**Septum linguae**, the partition of the tongue; a vertical median layer of fibrous tissue dividing the tongue into right and left halves. It sometimes includes a cartilaginous rod, as the *lytta* or so-called "worm" of a dog's tongue. See *lytta*.—**Septum lucidum**, the median partition of the lateral ventricles of the brain, inclosing the camera, pseudocoele, or so-called fifth ventricle. Also called *septum pellucidum, septum medium, septum ventriculorum, ventricular septum, septum medullare triangulare*. See *cut under corpus*.—**Septum narium**, the partition between the right and left nasal cavities or meatus of the nose. In man it is formed chiefly by the mesethmoid, or perpendicular plate of the ethmoid, the vomer, and the triangular cartilage of the nose.—**Septum nasi**. Same as *septum narium*. In zoology it is often restricted to the surface between the openings of the right and left nostrils, which may be of this or that character, deeply cleft as in the hare, hairy or naked, etc.—**Septum orbitale or orbitarium**, the orbital partition; any formation which separates the right and left eye-sockets. The term is less frequently used in relation to mammals, whose eyes are generally small and far apart, than among lower vertebrates, as birds, whose orbits are very large comparatively, and separated only by a thin vertical plate of bone, which may be perforated, or so far defective that the opposite orbits are thrown into one large cavity.—**Septum pectiniforme, the pectinated septum of the penis, a median vertical partition between the right and left cavernous bodies of that organ. ped apex. The flowers are monocious, terminal or axillary on young shoots, with their scales spirally set. The small and involucre staminate flower consists of an oblong column of united stamens, bearing crowded ovate connective scales, each with three to five anthers. The compressed seed bears a thick spongy margin, and contains four to six seed-leaves. There are but two species, both Californian, and ranking among the most remarkable of trees, growing straight, tall, and columnar, with short densely spreading branches, soft red wood, and very thick fibrous and spongy bark. They bear acute, compressed, and keeled decurrent narrow leaves, which are alternate and spirally inserted, or spread in two ranks on the younger branches. Their small cones ripen in the second year. For *S. sempervirens*, discovered by Menzies about 1794, see *redwood*. The other species, *S. gigantea*, by some formerly separated as a genus, *Washingtonia* (Winslow, 1854), and the *Washingtonia* of English gardens, is the mammoth tree or big tree of California. It is a less graceful tree, with shorter branches, pendulous branchlets, paler appressed leaves, its wood a duller red, with thin white sapwood, its bark near the ground 1 to 2 feet thick, and its cones much larger (2 to 3 inches long). It forms a series of forests in Tulare county, California, isolated groves extending 240 miles northward, and it has been recently (November, 1890) reported from southern Oregon. The tallest tree now known, one of the Calaveras grove, is 325 feet high; one known as the Grizzly Giant, in the Mariposa grove, is 93 feet in circumference at the ground; 1,200 rings were counted in a tree 11 feet in diameter. Both species were early classed under *Taxodium* (which see), their nearest American living relative; a closer ally, however, is *Athrotaxis* (Don, 1839), a genus of three Tasmanian trees distinguished by a cone with mucronate or umbonate scales; their other living relatives are a few distant and mostly monotypic genera of Japan and China. (Compare *Taxodium*.) A very large number of fossil species are known with certainty, showing that the genus was much more abundant in late Cretaceous and Tertiary time than at present.

From the etym. of the name, *seraphs* have usually been regarded as 'burning' or 'flaming' angels, consisting of or like fire, and associated with the ideas of light, ardor, and purity; but some authorities suppose the *serāphīm*, 'seraphs,' of Isa. vi. 2 to be of mythical origin, orig. denoting serpent forms (though this does not agree with the description in the passage, which indicates a shape in the main human), and identify them with the *serāphīm*, 'burning serpents,' of Num. xxi. 6. Cf. *seraphin*.] One of the celestial beings described in Isaiah vi. 1-6 as surrounding the throne of Jehovah. In angelology the seraphs are regarded as the highest order of angels (see *celestial hierarchy*, under *hierarchy*), and as having a twofold office, that of celebrating Jehovah's holiness and power, and serving as messengers and ministers between heaven and earth. See the etymology.

The only species, *S. serrulata*, is a native of Florida and South Carolina, known as *saw-palmetto* from the spiny-edged petioles. It is a dwarf palm growing in low tufts from a creeping branching caudex, which is clad with a network of fibers. The coriaceous leaves are terminal and orbicular, deeply parted into many narrow two-cleft segments. serf (sérf), *n.* [*< OF. (and F.) serf, fem. serve = Pr. serf = Sp. sirvo = Pg. It. servo, < L. servus, a slave; see serve.*] 1. A villein; one of those who in the middle ages were incapable of holding property, were attached to the land and transferred with it, and were subject to feudal services of the most menial description; in early Eng. hist., one who was not free, but by reason of being allowed to have an interest in the cultivation of the soil, and a portion of time to labor for himself, had attained a status superior to that of a slave.

The slave, indeed, still remained [in the fourteenth century], though the number of pure serfs bore a small proportion to the other cultivators of the soil. . . . But even this class had now acquired definite rights of its own; and, although we still find instances of the sale of serfs "with their litter," or family, apart from the land they tilled, yet, in the bulk of cases, the amount of service due from the serf had become limited by custom, and, on its due rendering, his holding was practically as secure as that of the freest tenant on the estate.

J. R. Green, Short Hist. of Eng. People, v. § 4.

The serf was bound to the soil, had fixed domestic relations, and participated in the religious life of the society; and the tendency of all his circumstances, as well as of

the opinions and sentiments of the time, was in the direction of liberation.

Encyc. Brit., XIX. 352.

2. A laborer rendering forced service on an estate under seigniorial prescription, as formerly in Russia.

In Russia, at the present moment, the aristocracy are dictated to by their emperor much as they themselves dictate to their serfs.

H. Spencer, Social Statics, p. 461.

The next important measure was the emancipation of the serfs in 1861. . . . The landlords, on receiving an indemnity, now released the serfs from their seigniorial rights, and the village commune became the actual property of the serf.

Encyc. Brit., XXI. 102.

3. Figuratively, an oppressed person; a menial. = *Syn. Serf, Slave*. The serf is, in strictness, attached to the soil, and goes with it in all sales or leases. The slave is absolutely the property of his master, and may be sold, given away, etc., like any other piece of personal property. See definitions of *peon* and *coolie*. See also *servitude*.

serfage (sér'fāj), *n.* [*< serf + -age. Cf. servage.*] Same as *serfdom*.

[In this and the next four senses usually spelled *serjeant*.] A servant; a retainer; an armed attendant; in the fourteenth century, one holding lands by tenure of military service, commonly used as not including those who had received knighthood (afterward called *esquires*). [In this sense the modern spelling is *serjeant*.] In England and Ireland, a lawyer of high rank. Serjeants at law are appointed by writ or patent of the crown, from among the utter barristers. While they have precedence socially, they are professionally inferior to queen's counsel; formerly, however, the king's (or queen's) premier serjeant and ancient serjeant had precedence of even the attorney-general and solicitor-general. Till the passing of the Judicature Act, 1873, the judges of the superior English common-law courts had to be serjeants; but this is not now required. No serjeants have been created since 1868, and the rank will in all likelihood soon become extinct.

The custom seems to have existed since the fourteenth century. The rings were presented to the eminent persons who might be present, their value differing greatly; thus, in 1429, Sir John Fortescue mentions the most costly rings as being given to any prince, duke, or archbishop, and to the lord chancellor and lord treasurer of England, rings of less value to earls, bishops, and certain officials, of less value again to members of Parliament, and so on.—**Sergeant trumpeter**, an officer of the British royal household since the sixteenth century, originally charged with the direction of a band of sixteen trumpeters. [The two spellings *serjeant* and *serjeant* are both correct, and were formerly used indifferently. *Serjeant*, however, is more in accordance with modern analogies, and now generally prevails except in the legal sense, and as applied to feudal tenants, to certain officers of the royal household, and, in part, to officers of municipal and legislative bodies, where the archaic spelling *serjeant* is retained. seriema (ser-i-ē'mā), *n.* [See *cariama*.] A remarkable South American bird, whose name is as unsettled in orthography as is its position in the ornithological system. It is usually regarded as gallatorial, and related to the cranes, but sometimes placed with the birds of prey, next to the African secretary-bird, which it resembles in some respects. It is 3 feet long; the wing 15 inches, the tail 13, the tarsus 7½;

the legs are bare above the suffrage; the head is crested with a frontal egret; the bill is red; the bare orbit bluish; the iris yellow; the plumage is dark, but somewhat variegated with lighter colors, and the tail is tipped with white. Thus, the elements lithium, sodium, potassium, rubidium, and cesium form a natural series having the familiar properties of the alkalis, and certain striking physical relations to the other elements. The hydrocarbon methane (CH₄), ethane (C₂H₆), propane (C₃H₈), etc., form a series having the constant difference CH₂ between successive members, but all the members having in common great chemical stability, slight reactive properties, and incapacity to unite directly with any element or radical.

7. In *systematic bot.*, according to Gray, the first group below kingdom and the next above class: equivalent to *subkingdom* or *division* (which see). In actual usage, however, this rule is by no means always observed. In Bentham and Hooker's "Genera" it is a group of cohorts with two stages between it and kingdom; and in the same and other good works it may be found denoting the first subdivision of an order, a tribe, a subtribe, a genus, and doubtless still other groups. It appears, however, always to mark a comprehensive and not very strongly accentuated division.

8. In *zool.*, a number of genera in a family, of families in an order, etc.; a section or division of a taxonomic group, containing two or more groups of a lower grade: loosely and variably used, like *grade*, *group*, *cohort*, *phalanx*, etc.—9. See *indeterminate*.—**Infinite series**, an algebraical expression appearing as a sum of terms, but differing therefrom in that the terms are infinite in number. The most usual way of writing an infinite series is to set down a few of the first terms added together, and then to append "+...", or "+ etc.", which is not addition, certainly, but is the indication of something analogous to the addition of the terms given. Another way is to write a general expression for any one of the terms of the series, and to prefix to this \sum , the sign for summation.—**In series**. 4. A hydrous silicate of magnesium, occurring massive, sometimes fine, granular, and compact, again finely fibrous, less often slaty. It is usually green in color, but of many different shades, also red, brown, or gray, sometimes with spots resembling a serpent's skin. There are numerous varieties, differing in structure and color. The most important of these are—precious or noble *serpentine*, under which term are comprised the more or less translucent *serpentine*s, having a rich oil-green color; foliated varieties, including *marino-lite* and *antigorite*; fibrous varieties, as *chrysotile* (sometimes called *serpentine asbestos*) and *metaxite*. Other minerals more or less closely allied to or identical with *serpentine* are *picrolite*, *williamsite*, *bowenite*, *retinite*, *balmorite*, *vorhausite*, *hydrophite*, *jenkinsite*, *villarsite*, etc. *Serpentine* occurs widely distributed and in abundance, forming rock-masses, many of which were formerly regarded as being of eruptive origin, but which are now generally conceded to have been formed by the metamorphism of various rocks and minerals; indeed, it has not been proved that *serpentine* has ever been formed in any other way than this. The *peridotites* appear to have been peculiarly liable to this kind of alteration, or *serpentinization*, as it is called. Massive *serpentine* has been extensively used for both interior and exterior architectural and decorative purposes, but in only a few localities is a material quarried which stands outdoor exposure without soon losing its polish, and eventually becoming disintegrated. The *serpentinous* rock commonly called *verd-antique*, and known to lithologists as *ophicalcite*, is a very beautiful decorative material, and has been extensively employed for ornament in various parts of the world. See *verd-antique*.

The Stones are loyn'd so artificially

Serranidae (se-ran'i-dē), *n. pl.* [NL. (Richardson, 1848), *< Serranus + -idae*.] A family of

acanthopterygian fishes, typified by the genus *Serranus*, related to the *Percidae* and by most ichthyologists united with that family, and containing about 40 genera and 300 species of carnivorous fishes of all warm seas, many of them known as *groupers*, *sea-bass*, *rockfish*, etc. (a) By Sir John Richardson, the name was applied in a vague and irregular manner, but his family included all the true *Serranidae* of recent ichthyologists. (b) By Jordan and Gilbert, the name was applied to all acanthopterygians with the ventral fins thoracic and perfect, the lower pharyngeal bones separate, scales well developed, pectoral fins entire, skull not especially cavernous, maxillary not sloping under the preorbital for its whole length, mouth nearly horizontal, and anal fin rather short. The family thus included the *Centropomidae* and *Rhytipidae*, as well as true *Serranidae*. (c) In Gill's system, the name was restricted to serranoids with the body oblong and compressed and covered with scales, the head compressed and the cranium normal, the supramaxillaries not retractile behind under the suborbitals, the spinous part of the dorsal fin about as long as the soft or longer, and three anal spines developed. The family as thus restricted includes about 300 fishes, which chiefly inhabit the tropical seas; but a considerable contingent live in the temperate seas. It includes many valuable food-fishes. The jewfish or black sea-bass is *Stereolepis gigas*; the stone-bass is *Polyprion cernium*. The groupers or garrupas are fishes of this family, of the genera *Epinephelus* and *Tristropis*. fin like a salmon's, and the belly compressed and armed with scales projecting so as to give it a saw-like appearance: typical of the subfamily *Serrasalmoninae*. See *piraya*.

They have a compressed high body, with the belly sharply compressed and the scales developed to give a serrated appearance to it; the branchial apertures wide; the branchial membrane deeply incised, and free below; the dorsal fin elongated, and an adipose fin. The teeth are well developed and mostly trenchant. The species are characteristic of the fresh waters of tropical South America. Among them are some of the most dreaded and carnivorous of fishes. By means of their sharp teeth they are enabled to cut the flesh of animals as with a pair of scissors, and where they are found it is impossible for an animal to go into the water without danger. They are attracted by the smell of blood, and congregate from considerable distances to any spot where blood has been spilt. They are best known by the name of *caribe*. Many species have been

described, some of which attain the length of 2 feet, but most are much smaller. See *parake*.

A *serrate-ciliate* leaf is one having fine hairs, like the eyelashes, on the serratures. A *serrate-dentate* leaf has the serratures toothed. In zoology and anatomy *serrate* is applied to very many structures much unlike one another, but having more or fewer similar teeth. — **Serrate antennae**, in entom., antennae whose joints are triangular and compressed, presenting a serrate outline on the inner margin; sometimes the outer joints (usually three in number) are enlarged, forming a serrate club. The phrase is sometimes restricted to the interfrontal suture, the sagittal being called *dentate*, and the coronal *limbose*, but the difference is slight, if any, and holds for few animals besides man. See cuts under *cranium* and *parietal*. — **Serrate tibiae**, in entom., tibiae which have a row of sharp teeth along the greater part of the outer edge, as in the *Scolytidae*. — **Serrate unguis**, in entom., unguis or claws having a row of sharp teeth on the lower edge. One who serves or attends, whether voluntarily or involuntarily; a person employed by another, and subject to his orders; one who exerts himself or herself, or labors, for the benefit of a master or an employer; an attendant; a subordinate assistant; an agent. In modern use it denotes specifically a domestic or menial helper. (See (c), below.) In law a servant is a person who, for a consideration, is bound to render service under the legal authority of another, such other being called the *master*. 7. In law, the burden of an easement; the condition of a tenement which is subject to some right of enjoyment by another than the owner of the tenement, in virtue of his ownership of another tenement. (See *easement*.) In Roman law, a right to use or deal with, in a given and definite manner, a thing belonging to another. As to real estate, it is nearly equivalent or correlative to the easement of the common law, except that it also embraces rights to take the fruits of the servient estate, which in English law are not called *easements*, but *profits à prendre*.—**Affirmative servitude**. See *negative servitude*, below.—**Discontinuous servitude**, in law, an easement which consists in the right to perform a series of distinct acts, as a right of way or of common, or the servitude answering thereto, such as cannot be enjoyed but by the intervention of man: distinguished from a *continuous servitude*, which consists in a constant servitude, or in the reservation of some characteristic of the servient tenement, as a right of view or a right to a watercourse.—**Negative servitude**, a servitude or easement which consists in the right merely to restrict the enjoyment of the owner of the servient tenement, as distinguished from one which entitles one to do an act which without the existence of the easement would be a positive wrong to the owner of that tenement. Thus, the right to receive light and air by windows over the land of another is a *negative servitude*, whereas the right to discharge water upon the land of another is an *affirmative servitude*.—**Personal servitude**, a right constituted over a subject in favor of a person, without reference to possession or property.—**Predial servitude**, a right constituted over one subject or tenement enjoyed by the owner of another subject or tenement. Predial servitudes are either *rural* or *urban*, according as they affect land or houses. The usual *rural servitudes* are passage or road, or the right which a person has to pass over another's land; pasture, or the right to send cattle to graze on another's land; fail and divot, or the right to cut turf and peats on another's land; aqueduct, or the right to have a stream of water conveyed through another's land; thirlage, or the right to have other people's corn sent to one's own mill to be ground. *Urban servitudes* consist chiefly in the right to use a party-wall, or a common drain, or to have the rain from one's roof drop on another's land or house; the right to prevent another from building so as to obstruct the windows of one's house; the right of the owner of a flat above to have his flat supported by the flat beneath, etc.—**Syn. 1.** Servdom, thralldom, vassalage, peonage.—**1 and 3.** *Servitude, Slavery, Bondage*. These words express involuntary subjection, and are in the order of strength. *Servitude* is the general word, its application to voluntary service being obsolete. *Slavery* emphasizes the completeness and the degradation of the state. *Bondage*, literally the state of being bound, is used chiefly in elevated style or figurative senses: as, *bondage* to appetite; Egyptian *bondage*. *Servitude* is the only one of these words that applies to compulsory and unpaid service required as a legal penalty; the phrase *penal servitude* is very common. See *serf* and *captivity*.

Its value lies chiefly in its seeds, from which is expressed the gingili, sesame-, or til-oil. The seeds are also variously used as food. There are about 10 species, natives of Europe and western Asia. They are perennial turf-forming grasses with flat or convolute leaves, and usually with short bluish or silvery-shining spikes. (b) In *arith.*, it expresses a superparticular ratio—that is, a ratio in which the greater term contains the less once, and one aliquot part over: thus, the ratio of 3 to 2 is *sesquialtera*, that of 4 to 3 *sesquialtera*, that of 5 to 4 *sesquialtera*, etc. But these words are rare in an English form. Thus, T. Hills in 1600 writes: "If the quotient be $\frac{1}{2}$ then it is named *sesquialtera*, if $\frac{1}{3}$ then *sesquitercia*, if $\frac{1}{4}$ then *sesquiquarta*, if $\frac{1}{5}$ then *sesquiquinta*, and so forth infinitely, which names cannot be englished otherwise but thus, once and a half, once and a third, once and a quarter, once and a fifth, etc."

(b) In *bot.*, noting that there is half as much more as the number of some other part to which a given part bears special relation, as where the stamens are one half as many more as the petals or sepals, or that a fertile flower is accompanied by an abortive one, as in some grasses; also, noting a large fertile floret accompanied by a small abortive one. (c) In *entom.*, noting any part or ornament which is accompanied by another half as large, or much smaller—as (1) an ocellated spot having a smaller one close to it, the two being generally inclosed by a common ring of color (also called *sesquialter* and *sesquicellus*); (2) a colored band crossing both of the outspread wings, and accompanied on either the primary or the secondary wing alone by another band; or (3) a cell or areolet of the wing to which a much smaller one is appended.

3. The time, space, or term during which a court, council, legislature, or the like meets daily for business, or transacts business regularly without breaking up. Thus, a *session* of the legislature commonly means the period from its assembling to its adjournment for the year or season, in contradistinction to its *daily sessions* during that period. So a *session* of Parliament comprises the time from its meeting to its prorogation, of which there is in general but one in each year. Technically at common law it was held that a meeting of Parliament could not be called a *session* unless the sovereign passed an act. The *session* of a judicial court is called a *term*. Also applied in the United States to the daily or half-daily periods of work of a school.

The *sessions* of the Reichstag must be public: it is not within its choice to make them private. A private *session* is regarded as, legally, only a private conference of the members of the Reichstag, and can have no public authority whatever.

It has the power to admit and discipline members, regulate the times of service, and administer all the spiritual affairs of the local church, and is answerable for its acts to the presbytery. In the Established Church of Scotland it is specifically called the *kirk session* (which see, under *kirk*).

The first and second divisions form what is called the *inner house*. There are five permanent lords ordinary, each of whom holds a court, the courts of the lords ordinary forming what is called the *outer house*. The junior lord ordinary officiates in the bill-chamber during session. See *bill-chamber*.—**Court of Sessions, Court of General Sessions, Court of Special Sessions**, in the United States, local criminal courts whose jurisdiction does not generally extend to offenses of the highest grades.—**General session of the peace**, in Great Britain, a meeting of the justices held for the pur-

pose of acting judicially for the whole district comprised within their commission. Similar judicial arrangements prevailed in most of the American colonies, also in some of the States subsequently to the Revolution.—**Special sessions**, sessions held by justices acting for a division of a county or riding, or for a borough, for the transaction of special business, such as granting licenses, etc.

sessional (ses'h'on-äl), *a.* [*< session* + *-al*.] Relating or belonging to a session or sessions.

Each (English) county is divided by its Quarter Sessions into petty *sessional* districts, and every neighborhood is given thus its own court of Petty Sessions—from which in almost all cases an appeal lies to Quarter Sessions.

sestina (ses-tê'nä), *n.* [*It.*: see *sestine*.] A poem in fixed form, borrowed from the French, and said to have been invented by the Provençal troubadour Arnaut Daniel (thirteenth century). It consisted originally of six stanzas of six unrhimed lines, with a final triplet or half-stanza, also unrhimed—all the lines being of the same length. The terminal words of stanzas 2 to 6 were the same as those of stanza 1, but arranged differently; and they were repeated in the triplet or envoy, partly at the end and partly in the middle of the lines. The modern *sestina* is written on two or three rimes, and the formula for a two-rimed *sestina* is thus given in the "Vers Français et leur Prosodie" of the best French authority, M. de Gramont: 1, 2, 3, 4, 5, 6; 6, 1, 5, 2, 4, 3; 3, 6, 4, 1, 2, 5; 5, 3, 2, 6, 1, 4; 4, 5, 1, 3, 6, 2; 2, 4, 3, 6, 5, 3, 1; triplet 2, 4, 6 at the end, and 1, 3, 5 at the beginning of the lines. In stanza 1, lines 1, 3, and 4 rime, and 2, 5, and 6 rime. *Sestinas* were written in Italy by Dante and Petrarch, in Spain and Portugal by Cervantes and Camoens, and in England by Drummond of Hawthornden (1585–1649). Mr. Swinburne (in "Poems and Ballads," 2d ser.) has achieved a double *sestina*.

5. In *law*: (a) The balancing or countervailing of one debt by another. (b) The claim of a debtor to have his debt extinguished in whole or in part by the application of a debt due from his creditor, or from one with whom his creditor is in privacy. Set-off is that right which exists between two persons each of whom, under an independent contract, owes an ascertained amount to the other, to set off their respective debts, by way of mutual deduction, so that the person to whom the larger debt is due shall recover the residue only after such deduction. (Kerr.) Set-off, counter-claim, and recoupment are terms often used indiscriminately. Counter-claim is more appropriate of any cross-demand on which the claimant might if he chose maintain an independent action, and on which, should he establish it as a cause of action, either in such independent action or by way of counter-claim when sued, he would be entitled to an affirmative judgment in his own favor for payment of the claim except so far as his adversary's claim might reduce or extinguish it. This use of the word distinguishes it from such claims as may be set off in favor of a person, which yet would not sustain an action by him, nor any affirmative judgment in his favor. Recoupment is appropriate only to designate a cross-demand considered as dependent on the concession of plaintiff's demand, subject to a right to cut down the amount recoverable by virtue of it. In these, which are the strict senses of the words, a recoupment only reduces plaintiff's demand, and leaves him to take judgment for what remains after the deduction; a set-off extinguishes the smaller of two independent demands and an equal amount of the larger, but may leave the residue of the latter unenforced; a counter-claim is one that may be established irrespective of the adversary's success or failure in establishing his claim, and although subject to be reduced or extinguished by the adversary's success, may otherwise be enforced in the same action.

This astrological association explains the identification by Pythagoras of the number *seven* with the opportune time (*καρπός*), as well as the fact that light was called *seven* by the Pythagoreans. That they termed it "motherless" may be due to the "seven spirits" of the Chaldeans—that is, the planets—being called "fatherless and motherless." The astrological association further explains why the number *seven* has so frequently been suggested by the conception of divine or spiritual influence, and why it was*

made the number of intelligence by Philolaus. The common statement that seven implies perfection has no further foundation than that the cabalistic meanings of all odd numbers are modes of perfection. One is the first, and was with the Pythagoreans the number of essence (ousia). Two involves otherness, and was the number of opinion, "because of its diversity." Three involves mediation, and was the number of beginning, middle, and end. Four naturally suggests a square, and so equity, and was commonly considered the number of justice; but it further carries the suggestion of system, and often has that signification. Five connects itself with the five fingers, used in counting ("Five of you shall chase an hundred"—Lev. xxv. 5); but the Pythagoreans, for some unknown reason, made it the number of marriage. Six played an important part in the sexagesimal system of the Chaldeans; but its Pythagorean meaning is doubtful. In the Apocalypse 666 is the number of the beast. Eight, being the first cube, would naturally suggest solidity; but according to Dr. Wordsworth it is the dominical or resurrection number. Nine, or three triads, was the number of the great gods of Egypt, and was considered efficient in all magical operations. Ten, for reasons connected with the history of the Pythagorean brotherhood, was considered by them as the great number of power. To eleven no particular significance is attached. Twelve was important in the Chaldean division of the circle, and was the number of the great gods. Thirteen, according to Dr. Mahan, is the number of schism. Seven was formerly used generally and vaguely to indicate a large number.

(d) In a scale, the seventh tone from the bottom; the leading-tone: solmized *si*, or, in the tonic sol-fa system, *ti*. The typical interval of the seventh is that between the first and the seventh tones of a major scale, which is acoustically represented by the ratio 8:15. Such a seventh is called *major*. A seventh a half-step shorter is called *minor*; and one two half-steps shorter is called *diminished*. All kinds of sevenths are classed as dissonances, the minor seventh being the most beautiful and the most useful of dissonant intervals. The seventh produced by taking two octaves downward from the sixth harmonic of the given tone is sometimes called the *natural seventh*; it is sometimes used in vocal music, and on instruments, like the violin, whose intonation is not fixed.

4. It is usually regarded as a chord of the ninth with the root omitted. Several different resolutions of it are possible. Such a chord on a keyboard instrument like the pianoforte is capable of four enharmonic interpretations, so that it is possible to modulate immediately from it into any one of the keys of the keyboard. Thus, in the key of G minor, the typical chord of the diminished seventh is (a), which on the keyboard is identical with either (b) in the key of B♭ minor, or (c) in that of C♯ minor, or (d) in that of E minor.—**Chord of the seventh**, in music, a chord of four tones, comprising a root with its third, fifth, and seventh; a seventh-chord or sept-chord. The most important seventh-chord is that whose root is the dominant of the key; it is often called the *chord of the dominant seventh*. The resolution of seventh-chords is highly important to the close and satisfactory structure of a composition: usually the seventh itself progresses downward. See *chord*, 4.—**Essential seventh**. 5. In law, separable and capable of being treated as separate from, though it may be not wholly independent of, another. Thus, a *several obligation* is one incurred by one person alone, as a bond by a single obligor, or concurrently with others, as in a subscription paper, in which latter case, though his promise is in a measure dependent on that of the other subscribers, the obligation of each may be *several*; while, on the other hand, in a contract by partners or an instrument expressed to be joint, the obligors are not at common law severally liable, but either has the right to have the others joined in an action to enforce payment. So a *several estate* is one which belongs to one person alone, and, although it may in a sense be dependent on others, it is not shared by others during its continuance. (See *estate*, 5.) A *joint and several obligation* is one which so far partakes of both qualities that the creditor may in general treat it in either way, by joining all or suing each one separately.

'distinction,' < secare, divide, cut: see secant.* A less specific designation for 'sex' was *L. genus = Gr. γένος, sex, gender: see gender, genus.*] 1. The character of being either male or female; the anatomical and physiological distinction between male and female, evidenced by the physical character of their generative organs, and the part taken by each in the function of reproduction; gender, by reference to living organisms. Sex is properly predicable only of male or female, those organisms which are neither male nor female being sexless or neuter. But the two sexes are often combined in the same individual, then said to be hermaphrodite or monœcious. Sex runs nearly throughout the animal kingdom, even down to the

protozoans, with, however, many exceptions here and there among hermaphrodites. The distinction of sex is probably the most profound and most nearly universal single attribute of organized beings, and among the higher animals at least it is accompanied or marked by some psychological as well as physical characteristics. The essential attribute of the male sex is the generation of spermatozoa, that of the female the generation of ova, accomplished in the one case by a testis or a homologous organ, and in the other by an ovary or a homologous organ. The act of procreation or begetting in the male is the uniting of spermatozoa to an ovum; the corresponding function in the female is the fecundation of an ovum by spermatozoa, resulting in conception or impregnation. The organs by which this result is accomplished are extremely varied in physical character; and various organs which characterize either sex, besides those directly concerned in the reproductive act, are known as secondary sexual characters. See *gender, generation, reproduction*, and quotation from Buck under *sexuality*, 1.

4. In bot., the character or structure of plants which corresponds to sex in animals, there being, except in the lowest orders, a clear differentiation of male and female elements. In flowering plants the male organ is the stamen, the female the pistil; in cryptogams different designations are used according to the class of plants, as antheridium, archegonium, etc. See *male*, 1, 2, and *n*. 2; *female*, 1, 2 (b), and *a*, 2 (b); and *Linnean system*, under *Linnean*.—**The fair sex**, the gentle (or gentler) sex, the softer sex, the weaker sex, the female sex collectively; womankind. ing, for measuring the angular distance of two stars or other objects, or the altitude of a star above the horizon, the two images being brought into coincidence by reflection from the transmitting horizon-glass, lettered *b* in the figure. The frame of a sextant is generally made of brass, the arc *h* being graduated upon a slip of silver. The handle *a* is of wood. The mirrors *b* and *c* are of plate-glass, silvered. The horizon-glass *b* is, however, only half silvered, so that rays from the horizon or other direct object may enter the telescope *e*. This telescope is carried in the ring *d*, and is capable of being adjusted, once for all, by a linear motion perpendicular to the plane of the sextant, so as to receive proper proportions of light from the silvered and unsilvered parts of the horizon-glass. The figure does not show the colored glass shades which may be interposed behind the horizon-glass and between this and the index-glass *c*, upon which the light from one of the objects is first received, in order to make the contact of the images more distinct. This index-glass is attached to the movable arm *f*. The movable arm is clamped by the screw *i*, and is furnished with a tangent screw *j*. The arc is read by means of a vernier carried by the arm,

with the reading-lens. In the hands of a competent observer, the accuracy of work with a sextant is surprising.

The first inventor of the sextant (or quadrant) was Newton, among whose papers a description of such an instrument was found after his death—not, however, until after its reinvention by Thomas Godfrey, of Philadelphia, in 1730, and, perhaps, by Hadley, in 1741.

Of the two sexes; done by means of the two sexes; reproductive: as, *sexual intercourse*; *sexual reproduction*.—4. Peculiar to or affecting the sexes or organs of sex; venereal: as, *sexual disease* or *malformation*.—5. Having sex; sexed; separated into two sexes; monœcious: the opposite of *asexual*: as, a *sexual animal*.—Secondary sexual characters, some or any characteristics, not immediately concerned in reproduction, which one sex has and the other sex has not; any structural peculiarity, excepting the organs of generation, which distinguishes male from female. Thus, the hair on a man's face and breast, the antlers of the

does the term of the peacock or any other difference in the plumage, and between the male and the female, the sexual characters of any kind, the characters of a fish, and hence other characters are included as secondary sexual characters, but not as primary sexual characters. Sexual affinity, or the inconspicuous or instinctive attraction of one sex for the other, as exhibited by the preference or choice of any one individual, rather than of any other, of the opposite sex, as a matter of sexual selection. In many cases selection is often called *choice*, *affinity* (after Goethe).

(b) Such degree of affinity between the sexes of different species as enables these species to interbreed or hybridize. — **Sexual dimorphism**, difference of form or other zoological character in the members of either sex, but not of both sexes, of any animal. Thus, a species of butterflies which has two kinds of males, or a species of butterflies whose females are of two sorts, exhibits sexual dimorphism. The term properly attaches to the adults of perfectly sexed animals, and not to the many instances of dimorphism among sexless or sexually immature organisms. Thus, the honey-bee is not a case of sexual dimorphism as there is only one sort of perfect males (the drones) and one of perfect females (the queen), though the hive consists mostly of a third sort of bees (workers or undeveloped females). Sexual dimorphism is common among invertebrates, rare in the higher animals. — **Sexual method**, in *bot.*, same as *sexual system*.

(b) — **Sexual organs**, organs immediately concerned in sexual intercourse or reproduction; the sexual system.

sexuality (sek-sju-al'i-ti), *n.* [*< sexual + -ity.*] 1. The character of sex; the state of being sexual or sexed or having sex; the distinction between the sexes; sex in the abstract.

It was known even before the time of Linnaeus that certain plants produced two kinds of flowers, ordinary open, and minute closed ones; and this fact formerly gave rise to warm controversies about the *sexuality* of plants.

Darwin, *Different Forms of Flowers*, p. 310.

Sex is a term employed with two significances, which are often confused, but which it is indispensable to distinguish accurately. Originally sex was applied to the organism as a whole, in recognition of the differentiation of the reproductive function. Secondly, sex, together with the adjectives male and female, has been applied to the essential reproductive elements, ovum and spermatozoon, which it is the function of the sexual organisms (or organs) to produce. According to a strict biological definition *sexuality* is the characteristic of the male and female reproductive elements (gamoblasts), and sex of the individuals in which the reproductive elements arise. A man has sex, a spermatozoon *sexuality*.

Buck's *Handbook of Med. Sciences*, VI. 436.

3. Shade within defined limits; the dark figure or image projected by a body when it intercepts the light. In optics *shadow* may be defined as a portion of space from which light is shut off by an opaque body. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows, though these are not distinguishable from each other, and hence the shadow of such an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow, the complete shadow being called the *umbra*. LG. (also D.) *schacht*, a shaft (in a mine), a particular use, appar. in allusion to its being straight and narrow, of *schacht*, a shaft or rod (as of a spear): see *shaft*¹.] 1. In mining, a vertical or inclined excavation made in opening the ground for mining purposes. A shaft may be sunk vertically, without regard to the dip of the lode, or it may be sunk by an incline following the lode, either closely or approximately, according as its dip is more or less regular. When it is expected that extensive operations will be carried on, the shafts are usually sunk vertically, and connected with the lode at various depths by cross-drifts or levels. When, however, the dip of the lode is pretty uniform and its thickness considerable, all the shafts of the mine may be sunk upon it as inclines. This is the case with the largest mines on Lake Superior. Shafts have various forms, some being round, others oval; but the most common shape is rectangular. In large mines the shaft is usually divided into several compartments, one being used for the pumping-machinery, two or more for hoisting ore, and another for lowering heavy timbers. In the English coal-mines the shafts are mostly circular in section; in Belgium, polygonal; in the anthracite region of Pennsylv-

A plant with trifoliate leaves: the national em-

ten and Holland, "English Plant Names") the plant at
the present day most in repute as the true shamrock is
one of the hop-clovers, *Trifolium minus*, a slender trail-
ing species with small yellow heads, perhaps a variety of
T. procumbens. It is in use in many counties of Ireland,
and forms a great part of the shamrock sold in London
on St. Patrick's day. The black medic, *Medicago lupu-
lina*, is also thus used; but the white clover, *T. repens*,
is widely understood to be the common shamrock. The
identity of the original shamrock which, according to tra-
dition, St. Patrick used to illustrate the doctrine of the
Trinity is uncertain. It has been variously supposed to
be the common white clover; *T. repens* (which, however,
is believed to be of late introduction in Ireland); the red
clover, *T. pratense*; the wood sorrel, *Oxalis Aceto sella*
(locally called *shamrock* in England); and even the water-

shark¹ (shärk), *n.* [Not found in ME. (the ME. name therefore being *hound-fish*): usually de-

rived *< L. carcharias, < Gr. kapnapios*, a kind of shark, so called from its sharp teeth, *< kapnapios*, jagged (of teeth); cf. *kapnapios*, a crab; Skt. *karkata*, a crab, *karkara*, hard. But the requisite OF. forms intermediate between E. *shark* and L. *carcharias* are not found, and it is not certain that the name was orig. applied to the fish; it may have been first used of a greedy man (see *shark*²).] A selachian of the subclass *Plagiostomi*, of an elongate form, with the pectoral fins moderately developed, the branchial apertures lateral, and the mouth inferior (rarely terminal). Over 150 species are known as inhabitants of the modern seas, and sharks formed a very important or even predominant contingent to the fauna of early epochs. The internal differences manifested by species as to have led some naturalists to propose for them three distinct orders, which have been named *Anarthri*, *Proarthri*, and *Opistharthri*. Most living sharks belong to the first order and represent therein 15 families, while of the *Proarthri* only one family with 4 species is known, and of the *Opistharthri* two families with 6 or 7 species. Most sharks are carnivorous, and some of them eminently so; their dentition corresponds to this character, the teeth being often compressed, with trenchant and frequently serrated edges, arranged in many rows, and folded back on the jaws, leaving only the outermost erect for action. These rows of teeth successively come into functional position. In others, however, the teeth are flattish and not erectile. In a few, also, which attain large size, the teeth are extremely small, and the animal feeds upon very small animals, being not truly carnivorous. The skin is generally covered with small scales or plates firmly adherent to the skin and overlapping, forming shagreen. (See cut under *scale*.) But various degrees are manifested in different forms, and in one, *Echinorhinidae*, the surface is mostly naked, only some thorn-like plates being developed. Sharks inhabit for the most part tropical and warm waters; the larger ones live in the open sea, but a few species extend into high north and south latitudes. The largest shark is *Rhinodon typicus*, the whale-shark, said to attain a length of over 50 feet. Next in size is the great basking-shark, *Cetorhinus maximus*, which is reported occasionally to reach a length of 40 feet. (See *Cetorhinus*, and cut under *basking-shark*.) Another large species is *Carcharodon ron-*

A barbed fish-spear with several prongs. *E. H. Knight*.—3. A strain consisting of a compression in one direction with an elongation in the same ratio in a direction perpendicular to the first. Thus, in fig. 1, suppose a body in which the axis AC is compressed to *ac*. Then, all planes perpendicular to the plane of the diagram and parallel either to AB or to AD will remain undistorted, being simply rotated into positions parallel to *ab* or *ad*. If the body while undergoing strain be so rotated that *a* and *b* remain in coincidence with A and B (see fig. 2), the shear will be seen

shears: see *shear²*.] 1. A cutting- or clipping-instrument consisting of two pivoted blades with beveled edges facing each other, such as is used for cutting cloth, or of a single piece of steel bent round until the blades meet, the elasticity of the back causing the blades to spring open when the pressure used in cutting has ceased. The density and homogeneity of the steel are increased by this process, and it is generally admitted that a better result is attained by hammering than by rolling. See *steel*.

shear-structure (shēr'struk'tūr), *n.* In *geol.*, a structure superinduced in rocks by shearing; a structure varying from lamellar to schistose, somewhat resembling the so-called "fluxion-structure" often seen in volcanic rocks, but produced by the flowing, not of molten, but of solid material, as one of the consequences of the immense strain by which the upheaval or plication of large masses of rock has been accompanied.

sheartail (shēr'tāl), *n.* 1. A humming-bird of the genus *Thaumastura*, having a very long forficulate tail, like a pair of shears, as *T. cora*, *T. hemicura*, etc. In the cora hummer (to which the

In *Doricha* (*Th. lanceolata*, etc.) the shape of the tail is simply forked, as the feathers lengthen from the shortest middle pair to the longest outer pair, like a

Shearwater, *Phaethon furcatus*

tern's. In all these cases the long feathers are very narrow and linear, or of about uniform width to their ends. The peculiar formation is confined to the males. *T. cora* has the tail (in the male) about 4 inches long, though the length of the bird is scarcely 6 inches; it is golden-green above and mostly white below, with a metallic crimson gorget reflecting blue in some lights, and the tail black and white. The female is 3½ inches long, the tail being 1½. It inhabits Peru. Five species of *Doricha* range from the Bahamas and parts of Mexico into Central America.

There are many species, mostly of the genus *Puffinus*, found on all seas, where they fly very low over the water, seeming to shear, shave, or graze it with their long blade-like wings (whence the name). Some of them are known as *hags* or *hagdens*. Three of the commonest are the greater shearwater, *P. major*; the Manx shearwater, *P. anglorum*; and the sooty shearwater, *P. fuliginosus*, all of the North Atlantic. sheep 1 (shēp), *n.*; pl. *sheep*. [*ME. sheep*, *shep*, *sheep*, *shepe*, *seep*, *seep*, *sep* (pl. *sheep*, *sheep*), < AS. *seap*, *seap* (pl. *seap*, *seap*) = OS. *seap* = OFries. *shep*, *shep* = D. *sheap* = MLG. *schāp*, LG. *schāp* = OHG. *seāp*, MHG. A ruminant mammal of the family *Bovidae*, subfamily *Ovis*, and genus *Ovis*; specifically, *Ovis aries*, domesticated in many varieties, and one of the animals most useful to man. The male is a ram, the female a ewe, and the young a lamb; the flesh of the adult is mutton; of the young, lamb; the coat or fleece is wool, a principal material of warm clothing; the prepared hide is sheepskin, used for many pur-

poses; the entrails furnish sausage-cases, and are also dried and twisted into strings for musical instruments ("catgut"); the prepared fat makes tallow or suet; and the twisted horns of the ram are used in the manufacture of various utensils. The milk of the ewe is thicker than that of the cow, yielding a relatively greater quantity of butter and cheese. The sheep is one of the most harmless and timid of animals. The artificial breeds of *O. aries* are numerous; it is not known from what wild stock or stocks they are descended. The moulin is a probable ancestor of some at least of the domestic varieties, especially those with short tail and crescentic horns. The principal English varieties of the sheep are the large Leicester, the Cotswold, the Southdown, the Cheviot, and the black-faced breeds. The Leicester comes early to maturity, attains a large size, has a fine full form, and carries more mutton, though not of finest quality, in the same apparent dimensions than any other; the wool is not so long as in some other breeds, but is considerably finer. The Cotswolds have been improved by crossing with Leicesters; their wool is fine, and their mutton fine-grained and full-sized. Southdowns have short, close, and curled wool, and their mutton is highly valued for its flavor; they attain a large size. All these require a good climate and rich pasture. The Cheviot is much harder, and is well adapted for the green, grassy hills of Highland districts; the wool is short, thick, and fine. The Cheviot possesses good fattening qualities, and yields excellent mutton. The black-faced is hardiest of all, and adapted for wild heathery hills and moors; its wool is long and coarse, but its mutton is the very finest. The Welsh resembles the black-faced, but is less hardy; its mutton is delicious, but its fleece weighs only about 2 pounds. The foreign breeds of sheep are numerous, some of the more remarkable being (a) the broad-tailed sheep, common in Asia and Egypt, and remarkable for its large heavy tail; (b) the Iceland sheep, having three, four, or five horns; (c) the fat-rumped sheep of Tatar, with an accumulation of fat on the rump, which, falling down in two great masses behind, often entirely conceals the tail; (d) the Astrakhan or Bucharian sheep, with the wool twisted in spiral curls, and of very fine quality; (e) the Wallachian or Cretan sheep, with very large, long, and spiral horns, those of the male being upright, and those of the female at right angles with the head. All the wild species of *Ovis* have the book-name *sheep*, and also particular designations. (See *argali*, *bighorn*, *mouflon*, *montsion*.) The only indigenous form in the New World is the Rocky Mountain sheep, or bighorn, *O. montana*. Certain *Ovis* of modern genera detached from *Ovis* are called *sheep* with a qualifying term, as the aoudad, or Barbary sheep. See cuts under *aoudad*, *bighorn*, *merino*, *Ovis*, *quadricon*, and *Ruminantia*.

Inoculation was practised during the first half of the present century, and frequently became the source of fresh outbreaks. It is now recommended only when the disease has actually appeared in a flock.

This bird is half-tamed in some places, like the *oider* duck, and laid under contribution for its eggs. The ruddy sheldrake or Brahminy duck is *T. casarca*, or *Casarca rutila*, wide-ranging like the foregoing. (e) In *Mollusca*, the test of any mollusk: the valve or valves of a shell fish; the chitinous or calcified product of the mantle; a conch. A shell in one, two, or several pieces is so highly characteristic of mollusks that these animals are commonly called shell-fish collectively, and many of them are grouped as *Tentacea*, *Conchifera*, etc. In some mollusks, as bibranchiate cephalopods, the shell is internal, constituting the pen or cuttle (see *cutanary*); in others there is no shell. The shell is secreted chiefly by a mantle or folds of the mantle which are developed around the soft parts, and is usually composed of carbonate of lime. It is generally univalve and spiral, as in most gastropods. In chitons there are eight valves imbricated in a longitudinal series, bound together by a marginal band. In bivalves two shells are developed from and cover the sides of the animal, right and left. (See cuts under *bivalve*.) Some mollusks otherwise bivalve have accessory valves. (f) In *Brachiopoda* there are two valves, but one covers the back and the other the abdominal region, so that the valves are dorsal and ventral. (j) In *Vermes*, the tube or case of a tubicolous worm, when hard, thick, or rigid, like a mollusk's shell: as, the shell of a serpulid. (k) In some *Protozoa*, a silicious or calcareous test or lorica of any kind. Such shells are present under numberless modifications, often beautifully shaped and highly complicated, perforated, cambered, etc., as in foraminifers, radiolarians, sun-animalcules, many infusorians, etc.

of the order by its opposite leaves, and by diadelphous flowers
with a four-lobed, somewhat spherical or oval calyx, and a
thick disk with eight lobes, the male flowers with eight
stamens and the ovary in the female with one cell and one
ovule. There are two species all natives of North America,
chiefly in the western United States—one, *S. Canadensis*,
with yellowish flowers and insipid reddish fruit, extend-
ing east to Vermont. They are small shrubs covered with
a silvery or rusty shining scurf, and bearing petioled ob-
long and entire leaves, small flowers in short spikes or rac-
emes, and numerous fleshy berries each formed of the
thickened, persistent part around the true fruit, which is
a small achene. *S. argentea*, the buffalo-berry, also known
as *sheepberry* and *sheepberry*, is an abundant spiny shrub
found from New Mexico and the Missouri to Hudson's
Bay; its branches are covered in autumn with clusters of
sordid berries of the size of currants, containing an edible
acid and mealy pulp, once an important article of food with
the Utah Indians.

scir-gerefa, 'shire-recve', *< scir*, shire, + *gere-
fa*, a reeve, officer; see *shire*¹ and *reeve*. Cf.
townreeve, *portreeve*.] The chief civil officer
charged with administering justice within a
county, under direction of the courts, or of the
crown or other executive head of the state, and
usually having also some incidental judicial
functions. (a) In England, the chief officer of the
crown in every county or shire, who does all the so-
vereign's business in the county, the crown by letters pa-
tent committing the custody of the county to him alone.
Sheriffs are appointed by the crown upon presentation of
the judges in a manner partly regulated by law and partly
by custom (see *pricke*), the citizens of London, however,
have the right of electing the sheriffs for the city of Lon-
don and the county of Middlesex. Those appointed are
bound under a penalty to serve the office, except in speci-
fied cases of exemption or disability. As keeper of the
queen's peace, the sheriff is the first man in the county,
and superior in rank to any nobleman therein during his
office, which he holds for a year. He is specially intrus-
ted with the execution of the laws and the preservation of
the peace, and for this purpose he has at his disposal the
whole civil force of the county—in old legal phraseology,
the *posse comitatus*. He has also some judicial functions,
less extensive now than formerly. The most ordinary of
his functions, which he always executes by a deputy called
under-sheriff, consists in the execution of writs. The sher-
iff performs in person such duties only as are either purely
honorary, such as attendance upon the judges on circuit,
or of some dignity and public importance, such as the pre-
siding over elections and the holding of county meetings,
which he may call at any time.

The reeve of the shire had doubtless been a fiscal of-
ficer from the beginning. It was the *Sheriff* who had to
see to the King's profit and his own in every corner of his
shire.
E. A. Freeman, *Norman Conquest*, V. 294.

(b) In Scotland, the chief local judge of a county. There
are two grades of sheriffs, the chief or superior sheriffs
and the sheriffs-substitute (besides the lord lieutenant of
the county, who has the honorary title of *sheriff-principal*),
both being appointed by the crown. The chief sheriff,
usually called simply the *sheriff*, may have more than one
substitute under him, and the discharge of the greater
part of the duties of the office now practically rests with
the sheriffs-substitute, the sheriff being (except in one or
two cases) a practising advocate in Edinburgh, while the
sheriff-substitute is prohibited from taking other employ-
ment, and must reside within his county. The civil juris-
diction of the sheriff extends to all personal actions on
contract, bond, or obligation without limit, actions for
rent, possessory actions, etc., in which cases there is an
appeal from the decision of the sheriff-substitute to the
sheriff, and from him to the Court of Session. He has
also a summary jurisdiction in small-debt cases where
the value is not more than £12. In criminal cases the
sheriff has jurisdiction in all offenses the punishment for
which is not more than two years' imprisonment. He has
also jurisdiction in bankruptcy cases to any amount. (c)
In the United States, except in New Hampshire and Rhode
Island, sheriffs are elected by popular vote, the qualifi-
cation being that the sheriff must be a man, of age, a citi-
zen of the United States and of the State, and a resident
in the county; usually he can hold no other office, and
is not eligible for reelection until after the lapse of a
limited period. In all the States there are deputy sheriffs,
who are agents and servants of the sheriff. In New York
and some other States there is, as in England, an under-
sheriff, who acts in place of his chief in the latter's ab-
sence, etc. The principal duties of the sheriff are to
preserve peace and order throughout the county, to at-
tend the courts as the administrative officer of the law,
to guard prisoners and juries, to serve the process and
execute the judgments of the courts, and to preside at
inquisitions and assessments of damages on default.—
High sheriff, the sheriff as distinguished from the under-
sheriff and other deputies. **Joint sheriff**, two persons
jointly appointed sheriff, or one of such persons.—**Sheriff
of Middlesex case**, a decision in 1840, noted in English
constitutional history, on the relative powers of Parlia-
ment to imprison for contempt and the courts to discharge
on habeas corpus.—**Sheriff's jury**. See *jury*. **Sheriff
turn**, in early Eng. law, the periodical court or session
held by a sheriff successively in the various hundreds of
his county, at which the freeholders were bound to appear
as a part of their service.—**Statute of sheriffs**. See
statute.

The AS. *scire, scyre* (often erroneously written with a long vowel, *scire, scyre*) is commonly explained as lit. a 'share' or 'portion' (i. e. 'a section, division'), directly < *scerian, sciran*, cut: see *shear*¹, and cf. *share*¹, from the same source. The mod. pron. with a long vowel is due to the lengthening of the orig. short vowel, as in the other words with a short radical vowel followed by *r* before a vowel which has become silent (e. g. *mere*¹, *tire*¹).] 1. A share; a portion.

An exact division thereof [Palestine] into twelve *shires* or shares.

 To behead high shire of all the shire.
 (Tales of Whittle (E. E. T. S.) p. 46.

The name *shire*, AS. *scir* or *scire*, which marks the division immediately superior to the hundred, merely means a subdivision or share of a larger whole, and was early used in connexion with an official name to designate the territorial shire appointed to the particular magistracy denoted by that name. So the diocese was the bishop's *scire*, and the stewardship of the unjust steward is called in the Anglo-Saxon translation of the Gospel his *scire*. We have seen that the original territorial hundreds may have been smaller *shires*. The historical *shires* or counties owe their origin to different causes.

(Stobbs, Const. Hist., § 48.

Shireman.—Any man who had not the good fortune to be born in one of the sister counties, or in Essex. Formerly, in England, a court or assembly of the county held periodically by the sheriff along with the bishop of the diocese, and with the ealdorman in shires that had ealdormen.

The presence of the ealdorman and the bishop, who legally sat with him, the sheriff in the *shire-moot*, and whose presence recalled the folk-moot from which it sprang, would necessarily be rare and irregular, while the reeve was bound to attend; and the result of this is seen in the way in which the *shire-moot* soon became known simply as the sheriff's court.

J. R. Green, Conquest of England, p. 230.

The *shiremoot*, like the hundredmoot, was competent to declare folkright in every suit, but its relation to the lower court was not, properly speaking, an appellate jurisdiction. Its function was to secure to the suitor the right which he had failed to obtain in the hundred.

He then proceeds to state, apparently as a corollary of what may be called his *bloody-shirt* principle, that our Revolution was not popular with what he terms the inferior classes. . . . But most assuredly the Americans did not want a visible signal to push them on; and he who should have displayed a *bloody shirt* for that purpose would have been followed by the contempt of the spectators, and saluted with stones by every idle boy in the streets.

More fully called *tai shogun* ('great general'), or *sei tai shogun*, 'barbarian-subduing great-general' (the earlier wars of the Japanese (when this form of the title was first used) having been waged against the 'barbarians' or aboriginal inhabitants of the country. The office was made hereditary in the Minamoto family in 1192, when the title was bestowed on a famous warrior and hero named Yoritomo, and continued in that family or some branch of it until 1868, when it was abolished, and the feudal system virtually came to an end. From the first a large share of the governing power naturally devolved on the shogun as the chief vassal of the mikado. This power was gradually extended by the encroachments of successive shoguns, especially of Iyeyasu, founder in 1603 of the Tokugawa line, and in course of time the shoguns became the virtual rulers of the country—always, however, acknowledging the supremacy of the mikado, and professing to act in his name. This state of things has given rise to the common but erroneous opinion and assertion that Japan had two emperors—"a spiritual emperor" (the mikado), living in Kyoto, and "a temporal emperor" (the shogun), who held court in Yedo (now called Tokio). In the troubles which arose subsequent to 1858 in connection with the ratification and enforcement of the treaties which the shogunate had made with foreign nations, establishing trade relations, etc., many of the daimios, tired of the domination of the shogun and disapproving of the treaties, sided with the emperor; this led in 1867 to the resignation of the shogun of the time, and in the following year the office was abolished, the reigning mikado undertaking to govern the country in person. To shoot spawn, to spawn, as certain fish. For example, the male and female shed in spawning, swim about in circles, probably following the eddies of the stream, sometimes with the dorsal fins out of the water, when suddenly the whole shed as if seized by a common impulse, dart forward and discharge clouds of milt and spawn into the water. [Nautical slang.] To shoot to spoil, to dump (excavated material) on an inclined surface in such a manner that it will shoot or roll down on the declivity.

The question is simply this—whether it is easier to chip away 50,000 yards of rock, and shoot it to spoil (to borrow a railway term) down a hill-side, or to quarry 50,000 cubic yards of stone, remove it, probably a mile at least, to the place where the temple is to be built, and then to raise and set it.

Most shore-whaling in America is now done on the Pacific coast, and the men employed are mainly foreigners. California shore-whaling was begun at Monterey in 1851 by Captain Bayen port, and conducted much as it had been for 150 years in New England. This method is distinguished from both coast-whaling and deep-sea whaling. See *whaling*.

The Teut. forms, AS. *seort*, OHG. *searz*, etc., are commonly supposed to be identical with L. *curtus* (assumed to stand for **seurtus*), but the phonetic conditions do not agree (AS. *t* = L. *d*). 'shorn'; but the sense requires the formative to be *-d*, E. *-d*² (as in *old*, *cold*, etc.), and the adj. word formed from *secran* with this pp. suffix is in fact AS. *secard* (see *shard*). 14. Not prolonged in utterance; less in duration than times or sounds called long: said of times, vowels, and syllables. Specifically— (a) In *pros.*, not exceeding in duration the unit of time (*mora*, *semeion*), or so regarded. The ordinary short vowel of ancient pronunciation varied somewhat in actual duration, but seems to have usually been uttered as rapidly as was consistent with full distinctness of sound. (See *long*¹, *n.*, 2.) Sometimes in metrical or rhythmical treatment a short syllable occupied less time in utterance than a normal short (was a *diminished short*, *βραχεία μειωμένη*), and in what is commonly known as *elision* the first of two vowel-sounds, although still audible, was shortened to such a degree as to be entirely disregarded in metrical composition. A syllable containing a short vowel was regarded as short unless the vowel stood in *position* (which see). Rhythmical or musical composition occasionally allowed itself the liberty of treating a prosodic short as a long (an *augmented short*, *βραχεία ηυξημένη*), and vice versa. In metrical composition a short syllable usually did not take the ictus; hence, in modern versification, an unaccented syllable, whatever its duration, is said to be *short*. A short time, vowel, or syllable is marked by a curved line written independently or above the vowel: thus, *υ, ā*.

Projectiles for large guns are seldom called by this name without some qualifying term, as, *solid shot*, *round shot*, *grape-shot*. The stream of metal breaks into drops which become spherical. To obviate the use of the high tower, various expedients have been tried, such as dropping the metal through a tube up through which a strong current of air is driven, or dropping it through a column of glycerin or oil. Such shot is assorted by sizes of the pellets, distinguished by letters as *BB*, spoken *double-B*, or by numbers (usually Nos. 1 to 10 or 12), or by specific names as *swan shot*, etc.).

Shot-guns are usually either single-barreled or double-barreled; rarely a third barrel is added; sometimes one of the barrels is rifled (see the quotation). Besides being smooth-bored, a shot-gun differs from any form of rifle in having no hind-sight and a simple pin as fore-sight. Shot-guns are also distinguished as *muzzle-loaders* and *breech-loaders*; the former are little used now. Though the bore is always smooth, it is often contracted toward the muzzle to concentrate the discharge. (See *choke-bore*.) The standard shot-gun now most used by sportsmen is the double-barreled breech-loader, of 7 to 10 pounds weight, about 30 inches length of barrel, length and drop of stock fitting the shooter, often with pistol-grip, caliber usually 10, 12, or 14, and taking corresponding sizes of paper or metal shot-cartridges (see *shell*) with center-fire primers or percussion-caps and an automatic ejector; such as have the cock or hammer concealed in the mechanism of the lock are specified as *hammerless*. The special makes are numberless, but decided variations from the standard pattern are rare. Shot-guns are seldom fitted with hair-triggers, but usually with rebounding locks, in which the hammer flies back to half-cock on delivering the blow on the plunger. A special form of shot-gun, used by naturalists, is described under *came-gun*.

The human shoulder-blade is somewhat peculiar in shape, and some of its parts are named in terms not applicable or seldom applied to scapulae in general. It is a compound bone, including a coracoid as a mere process, and develops from seven centers of ossification, two of which are coracoid. It is commonly said to have two surfaces, three borders, and three angles. Of these, the ventral surface, which lies upon the ribs, is the *venter*; the other surface is the *dorsum*. This latter is unequally divided into two parts by the development of a high ridge, the *spine*, extended into a stout process, the *acromion*. The flat part above the spine is the *supraspinous fossa*; that below the spine is the *infraspinous fossa*; the venter is also called the *subscapular fossa*. These three fossae indicate the primitively prismatic and rod-like character of the bone; and they correspond respectively to the *prescapular*, *postscapular*, and *subscapular* surfaces of a more general nomenclature. The spine being actually in the axis of the scapula, it follows that the long *vertebral border* (a_1 to a_2 in the figure) is the proximal end of the bone. The *glenoid fossa* is at the other end of the bone, at its confluence with the coracoid. The

Human Shoulder-blade, or Scapula (right, dorsal surface). a_1 , superior angle; a_2 , inferior angle; ac , acromion; av , axillary border; c , coracoid; g , glenoid cavity for articulation with humerus; r , infraspinous fossa; n , neck and suprascapular notch in superior border; e , spine; rs , supraspinous fossa; v , vertebral border, extending from a_1 to a_2 .

axillary border is one edge of the primitive prism; the *suprascapular border* is another, and the third is along the free edge of the spine. The *suprascapular notch* in the superior border (converted into a foramen by a ligament) denotes the passage there of the vessels and nerve called by the same name. The peculiarities of the human scapula result mainly from its extensive growth downward to the inferior angle (a_2), with consequent lengthening of the axillary border and of the so-called vertebral "border," and from great development of the spine and acromion. This bone, as usual in the higher vertebrates, has two articulations—with the clavicle and with the humerus; excepting the acromioclavicular articulation, it is attached to the trunk solely by muscles, of which sixteen (sometimes seventeen) arise from or are inserted into the bone. (Compare the shape of the rabbit's shoulder-blade, figured under *metacromion*, and of a bird's, under *scapula*.) See also cut under *shoulder*.

They are all small, greatly resembling mice in size, form, color, and general appearance (whence the name *shrew-mouse*), but belong to a different order (*Insectivora*, not *Rodentia*). They are widely distributed, chiefly in the northern hemisphere, and the species are numerous, of several different genera, particularly *Sorex*, which contains more than any other. The little animals are very voracious, and devour great quantities of insects and worms; but there is no foundation in fact for the vulgar notion that shrews are poisonous, or for any other of the popular superstitions respecting these harmless little creatures. The shrews have usually a musky odor, due to the secretion of some special subcutaneous glands with which they are provided, and in some of the larger kinds this scent is very strong. Among the shrews are the most diminutive of all mammals, with the head and body less than 2 inches

long; others are two or three times as large as this. The common shrew of Europe is *Sorex vulgaris*. The common-

He had assumed that she had also assimilated him, and his country with him—a process which would have for its consequence that the other country, the ugly, vulgar, superfluous one, would be, as he mentally phrased it to himself, *shunted*. *H. James, Jr.*, *Harper's Mag.*, LXXVII. 108.

The current passing through a galvanometer or other measuring-instrument may be reduced in any desired degree by the introduction of a shunt; and the factor by which the current indicated by the in-

This picture is always covered with 3 shutters, one of which is of massed silver.

Hence, specifically, the frame of panel of wood or iron or other strong material used as a cover, usually for a window, in order to shut out the light, to prevent spectators from seeing the interior, or to serve as a protection for the aperture. There are inside and outside shutters.

Inside shutters are usually in several hinged pieces which fold back into a recessed casing in the wall called a *box-ing*. The principal piece is called the *front shutter*, and the auxiliary piece a *back flap*. Some shutters are arranged to be opened or closed by a sliding movement, either horizontally or vertically, and others, particularly those for shops, are made in sections, so as to be entirely removable from the window. Shutters for shop-fronts are also made to roll up like curtains, to fold like Venetian blinds, etc.

If the Sun is incommensurable, we have thick folding Shutters on the outside, and thin ones within, to prevent that.

The more mechanically elaborate shutters are actuated by springs, and are commonly so arranged that the speed of the exposure can be regulated. — **Bolt and shutter.** See *bolt*. **Boxed shutter**, a window-shutter so made as to fold back into a recessed box or casing. **Shutter in.** (a) A plank, called a *strake*, that is fitted with more than ordinary accuracy to the planks between which it is placed. die for the reception of the bobbin or pin on which the weft is wound. The weft unwinds from this bobbin as the shuttle runs from one side of the web to the other. It is driven across by a smart blow from a pin called a *picker* or *driver*. There is one of these pins on each side of the loom, and the two are connected by a cord to which a handle is attached. Holding this handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. A shuttle propelled in this manner is called a *fly-shuttle*, and was invented in 1738 by John Kay, a mechanic of Colchester, England. Before this invention the weaver took the shuttle between the finger and thumb of each hand alternately and threw it across, by which process much time was lost. There are also a great variety of automatic picker-motions for driving the shuttles of looms. Compare *picker-motion*.

The shuttle travels on a roller-carriage drawn by a cord in the shuttle-race below the warp-threads, and having also a set of upper rollers. The shuttle has also a pair of under rollers, one at each end, and travels over the lower series of warp-threads through the shed, being pushed along by the carriage while the warp-threads are passed, without straining them, between the upper rollers of the carriage and the rollers of the shuttle. Compare *positive-motion loom*, under *loom*. — **Weaver's-shuttle**, in *conch.*, a shuttle-shell, as *Radiis volva*. See *cut under shuttle-shell*.

They are prostrate, rough-hairy herbs, often rooting at the joints, bearing alternate or clustered roundish scalloped or cleft leaves, and red or yellowish axillary flowers. *S. Europæa*, from its round leaves, is known as *pennycuort*, *penny-pies*, and *Cornish moneywort*.

sibyl (sib'il), *n.* [Formerly also *sibyll*; often misspelled *sybil*, *sybill*; also used as *L. sibylla*; = *D. sibille* = *G. sibylle* = *Sw. sibylla* = *Dan. sibylle* = *F. sibylle* = *Pr. sibilla* = *Sp. sibila* = *Pg. sibilla*, *sibylla* = *It. sibilla*, *< L. sibylla*, also *sibulla*, *ML.* also *sibilla*, *< Gr. σίβυλλα*, a sibyl, prophetess; formerly explained as 'she who tells the will of Zeus,' *< Διός βουλή*, the will of Zeus (*Διός*, gen. of *Zeus*, Zeus, Jove; *βουλή*, will); or 'the will of God,' *< θεός* (Doric *σιός*), god, + *βουλή*, will; but such explanation is untenable. The root is appar. *σιβ-*, which is perhaps = *L. sib-* in *per-sibus*, acute, wise, and related to *Gr. σοφός*, wise (see *sophist*), and *L. sapere*, be wise, perceive; see *sapient*, *sage*.] 1. In *anc. myth.*, one of certain women reputed to possess special powers of prophecy or divination and intercession with the gods in behalf of those who resorted to them. Different writers mention from one to twelve sibyls, but the number commonly reckoned is ten, enumerated as the Persian or Babylonian, Libyan, Delphian, Cimmerian, Erythraean, Samian, Cumaean, Hellespontine or Trojan, Phrygian, and Tiburtine. Of these the most celebrated was the Cumaean sibyl (of Cumæ in Italy), who, according to the story, appeared before Tarquin the Proud and offered him nine books for sale. He refused to buy them, whereupon she burned three, and offered the remaining six at the original price. On being again refused, she destroyed three more, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These sibylline books, or books professing to have this origin, written in Greek hexameters, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter in 83 B. C. Fresh collections were made, which were finally destroyed soon after A. D. 400. The Sibylline Oracles referred to by the Christian fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with probably here and there a snatch from the older pagan source. In composition they seem to be of various dates, from the second century before to the third century after Christ.

4. One of the extended marginal parts or courses of a surface or a plane figure; one of any number of distinct terminal confines or lateral divisions of a surface contiguous to or continuous with another surface: as, the opposite *sides* of a road or a river; the east and west *sides* of the ocean; all *sides* of a field. The outer parts of an oblong or an irregular surface may all be called *sides*, or distinguished as the long and short *sides*, or as *sides* and *ends*, according to occasion. *Side* in this sense is more comprehensive than *margin*, *edge*, *border*, or *verge* (commonly used in defining it), since it may be used so as to include a larger extent of contiguous surface than any of these words. Thus, the *sides* of a room may be all the parts of its floor-space not comprised in a central part reserved or differentiated in some special way. The *sides* of a table are those marginal parts upon which food is served. The east and west *sides* of a continent may constitute jointly the whole of it, or may consist of larger or smaller mar-

ginal strips or divisions, according as they are considered as separated by a mesial line or by some intervening region. The amount of latitude with which the word may be used in particular cases does not admit of definitive discrimination; but there is usually no difficulty in determining the intention of a writer or speaker in his employment of it.

A great market-place
Upon two other *sides* fills all the space.
William Morris, *Earthly Paradise*, I. 4.

5. Position or place with reference to an intermediate line or area; a space or stretch divided from another by the limit or course of something: preceded by *on* and followed by *of*, either expressed or (sometimes) understood: as, a region on both *sides* of a river; we shall not meet again this *side* the grave.

It appears also to have been a never-failing usage in connection with this fashion of a sideless kirtle to display the girdle of the under-tunic, which rested loosely on the hips, as it passed under the sideless garment both before and behind.

Plants are distributed in the constellations or zodiacal signs, and are constituted by fixed stars. The sidereal calendar, or sidereal calculation, is a system of sidereal time. The sidereal day is the time between two successive passages of a star over the meridian. It is a precise synonym of *stellar day*, although in some cases it is used interchangeably with *stellar*. Thus, the sidereal day is the time between two passages of a star over the meridian. The sidereal year is the time between two successive passages of a star over the meridian.

The sidereal day is the period and promptly of all terrestrial and celestial light. *Epiphany* of Rabehus, 1. 10.

And see the sorts of the sky unfold
The sun and speckles of celestial gold.

Sidereal clock or chronometer, a clock or chronometer that keeps sidereal time. — **Sidereal day, hour, month.** See the nouns. — **Sidereal magnetism**, according to the heliophysics, a magnetic influence of the stars upon planets. — **Sidereal system**, the system of stars. The solar system is considered a member of the sidereal system, in the same sense as the earth with its moon, and Saturn with its satellites, are considered members of the solar system. — **Sidereal time**, time as measured by the apparent diurnal motion of the stars. The sidereal day, the fundamental period of sidereal time, is taken to be 24 hours, with the passage over the meridian of the vernal equinox, the first point of Aries, or the origin of right ascension (three names for the same thing). There is just one more sidereal than mean solar day in a sidereal year. The sidereal day is 3m. 55.91s. shorter than a mean solar day. The sidereal time of mean noon is 0 hours on March 21 (1st, leap years), 0 hours on June 21st, 12 hours on September 21st (1st, years preceding leap years), and 18 hours on December 21st (20th, leap years). These dates are for the meridian of Washington. For Greenwich, it is 9 hours on March 21st in all years, and 6 hours on June 21st in years preceding leap years. Sidereal time is the only uniform standard of time-measurement, and this cannot be absolutely uniform, since the friction of the tides must tend to retard the motion of the earth. — **Sidereal year**, the time in which the earth makes one complete revolution round the sun. The ratio of the sidereal year to the tropical year is that of unity to unity minus the quotient of the yearly precession by 360°—that is, it is longer than the tropical year by 20m. 23.3s.; its length is thus 365 days 6 hours 9 minutes 9.5 seconds.

siderolite (sid'e-rō-līt), *n.* [*Gr. σίδηρος*, iron, + *λίθος*, stone.] 1. A name first given by N. S. Maskelyne (in the form *aëro-siderolite*) to those meteorites which G. Rose had previously called *pallasites*. For meteorites consisting chiefly of metallic (nickeliferous) iron the name *siderite* was proposed by C. U. Shepard, and that of *holosiderite* by Daubrée; but the former is not admissible, because this name was long ago preoccupied by a well-known and widely distributed mineral species, and the latter cannot be accepted, because the majority of the specimens so designated are not wholly of iron. The name *siderolite* has therefore been transferred by M. E. Wadsworth to those meteorites which are composed chiefly of iron—in most cases, however, enclosing more or less irregular and nodular masses of pyrrhotite, schreibersite, graphite, etc. The same author includes in *siderolite* masses of iron of similar character although of terrestrial origin, as those of Ovikaf in Greenland. See *meteorite*, under which the meaning of *pallasite* is given.

There are 60 or 70 species, widely scattered through the tropics, a few occurring beyond them, in South Africa, Australia, and New Zealand, and one in Madeira. They are trees or shrubs, either smooth or hairy, bearing thin and veiny but rigid leaves, destitute of stipules. The somewhat bell-shaped and usually small flowers are borne in sessile or pedicelled axillary clusters, which are commonly white or whitish. The species are known in general as *ironwood*, especially *S. argentea* of Cape Colony. One yellow-flowered species extends into Florida, for which see *mastic-tree*. A distinguishing sign, mark, or manifestation; an indicative appearance or characteristic, either physical or mental; a condition or quality significant of something: as, the *signatures* of a person's temperament seen in his face. [Formerly used with much latitude, but now archaic or technical.]

Specifically.—2. An external natural marking upon, or a symbolical appearance or characteristic of, a plant, mineral, or other object or substance, formerly supposed by the Paracelsians (and still by some ignorant persons) to indicate its special medicinal quality or appropriate use. The medical theory based upon this conception, known as the *doctrine of signatures*, took note of color (as yellow flowers for jaundice and the bloodstone for hemorrhage), shape (as that of the roots of mandrake and ginseng), various peculiarities of marking, etc. Many existing names of plants, minerals, etc., originated from this theory. See *Kidneywort*, *mandrake*, *scorpion-grass*. Also called *sign*, *seal*, and *sigil*.

Some also, pretending themselves *Natures* Principal Secretaries, have found out [in certain plants] . . . *Signatures* of *Natures* owne impression, fitted to their several and speciall uses in Physicke. *Purchas*, *Pilgrimage*, p. 505.

W. K. Clifford, *Lectures*, I. 130.

3. The name of a person, or something used as representing his name, affixed or appended to a writing or the like, either by himself or by deputy, as a verification, authentication, or assent (as to a petition or a pledge). The initials, the first or familiar name by which one is known, or the mark or sign of the cross, and the like, if affixed by the person for that purpose, is a legal signature. A British peer uses his title as signature: thus, the Marquis of Salisbury signs himself simply "Salisbury." Prelates of the Church of England adopt signatures from the Latinized designations of their sees: thus, the Archbishop of Canterbury (E. W. Benson) signs himself "E. W. Cantuar.," the Bishop of Oxford (W. Stubbs), "W. Oxon." See *sign*, *v.* 1, 2, 3.

4. In *Scots law*, a writing formerly prepared and presented by a writer to the signet to the baron of exchequer, as the ground of a royal grant to the person in whose name it was presented. This, having in the case of an original charter the sign manual of the sovereign, and in other cases the *cachet* appointed by the act of union for Scotland, attached to it, became the warrant of a conveyance under one or other of the seals, according to the nature of the subject or the object in view. *Imp. Dict.*

5. A letter or figure placed by the printer at the foot of the first page of every section or gathering of a book. The letters begin with A, the figures with 1, and follow in regular order on succeeding sections. They are intended to aid the binder in folding, collating, and arranging the sections consecutively. In early printed books the signature-mark was often repeated on the 3d, 5th, and 7th pages of a section of 16 pages as an additional safeguard for the folder: as, A on 1st page, A 1 on 3d, A 11 on 5th, and A 1 v on 7th page. This practice has been discontinued except for offsets of 12mos, which have the signature repeated.

Hence.—6. A sheet; especially, in bookbinders' use, a sheet after it has been folded and is ready to be gathered.—7. In *musical notation*, the signs placed at the beginning of a staff to indicate the key (tonality) and the rhythm of a piece. The term properly includes the clef (which see), since it determines the form of the key-signature. The key-signature consists of sharps or flats placed upon the degrees corresponding to the black digitalis of the keyboard that are to be used; their number and position show also the position of the key-note. The key-signature of a minor key is the same as that of its relative major key. A key-signature made up of sharps is called a *sharp signature*; one made up of flats is called a *flat signature*. The key-signature may be altered in the course of the piece. In this case heavy bar is inserted, and the sharps or flats that are not to continue in force are nullified by cancels (naturals) prefixed to the new signature. The key-signatures most in use with the common G and F clefs are as follows:

Some slight variations in the above forms occur. (See *key*, *key-signature*, and *circle of keys* (under *circle*)). The rhythmic signature, or time-signature, consists of two numerals, the upper of which indicates the number of principal beats in the measure, and the lower the kind of note chosen to represent one such beat. (See *rhythm*, and *rhythmic signature* (under *rhythmical*)). The key-signature is usually repeated at the beginning of every brace; but the rhythmic signature is given but once.

A seal, especially a private seal, used instead of signing the name, or in addition to it, for verification of papers or the like. The signet in Scotland is a seal by which royal warrants connected with the administration of justice were formerly authenticated. Hence the title of *writers to the signet* or *clerks of the signet*, a class of legal practitioners in Edinburgh who formerly had important privileges, which are now nearly abolished. They act generally as agents or attorneys in conducting causes before the Court of Session. In English administration the signet is one of the seals for the authentication of royal grants, which before the abolition of the signet-office in 1848 was there affixed to documents before passing the privy seal, but it is not now required.

Which was the model of that Danish seal.

Silene (sī-lē'nē), *n.* [NL. (Linnaeus, 1737), so called in allusion to the frequent sticky exudation on its stems; < L. *Silenus*, Silenus: see *Silenus*.] A genus of polypetalous plants, of the order *Caryophyllaceae*, type of the tribe *Sileneae*. It is characterized by flowers usually with a ten-nerved five-toothed club-shaped ovoid or inflated calyx, five spreading petals upon erect and slender claws commonly with two small scales, ten stamens, and a stalked ovary with one cell, a free central placenta, and usually three styles, the capsule opening at the top by six or by three short valves to discharge the numerous opaque and roughened seeds. About 480 species have been described, but only about 250 are now thought to be distinct. They are annual or perennial herbs of great variety of habit, tall and erect, tufted or procumbent, or partial climbers, with narrow entire opposite leaves, and pink, scarlet, white, or variously colored flowers, commonly in cymes or in one-sided spikes disposed in a terminal panicle. They are abundant in Asia north of the tropics, and in southern Europe and northern Africa, and there are about 12 species in South Africa. Besides 5 or 6 introduced species in the Atlantic border, the United States contains about 32 species, chiefly in the Rocky Mountain and Pacific region, about half of which are nearly or quite confined to California. Most of the species are known as *catch-flies*. Many are cultivated for their flowers, especially *S. viscosa* and *S. Schaffa*, with *S. Armeria*, the sweetwilliam or Lobel's catch-fly, native of the south of Europe. *S. Pennsylvanica*, a glutinous early-flowering species, is the wild pink of the eastern United States (see cut under *anthophore*). (For *S. Virginia*, see *pre-pink*, under *pink*.) Many species with an inflated bladder-like calyx are known in general as *campion*, among which *S. Otites*, abundant in sands of eastern Europe and known as *Spanish campion*, is used as an astringent. (For *S. acaulis*, also known in England as *cushion-pink*, see *moss-campion*.) *S. Cucubalus* (*S. inflata*), the bladder-campion, is a wide-spread species of Europe, central and northern Asia, now introduced in the Atlantic United States. It is also called *behen* and *spatling poppy*; also, from the shape of its calyx, in America *cowbell*, in England *knapbottle* and *whitebottle*. *S. maritima* of the English coast (perhaps a variety of the last) has been called *witches' thimble*.

It is characterized by flowers with a united and more or less tubular four- or five-toothed calyx, five petals with spreading border and a slender claw often bearing two scales at its summit, usually ten stamens, two or more styles separate to the base—the ovary, stamens, and petals all commonly elevated on a stalk-like gynophore or continuation of the receptacle. It includes 11 genera, all natives of the Old World except certain species of *Dianthus* and *Silene*. (See also *Saponaria*, *Lychnis*, and *Gypsophila*.) Most of the genera are cultivated for their ornamental flowers as the pink, catchfly, etc., which resemble salver-shaped flowers, as phlox, in form, but are composed of separate petals.

In Sollas's classification the term is restricted to *Micro-mastella* having a skeleton the scleres of which are not calcareous, being thus the silicious sponges without the *Myxospongiæ*. Also *Silicispongæ*. See cuts under *Porifera* and *Spongilla*.

silicon (sil'i-kon), *n.* [< *NL. silicon*, < *L. silex* (*silic-*), flint: see *silex*, *silica*.] Chemical symbol, Si; atomic weight, 28.19. A non-metallic element which is obtained in three allotropic forms—namely, amorphous, as a dull-brown powder soluble in alkali, which burns when ignited; graphitic, in crystalline leaves having a strong metallic luster and lead-gray color, insoluble in alkali and non-combustible; and crystalline, in octahedral needles having a red luster, and hardness a little less than that of the diamond. Next to oxygen, silicon is the most abundant element in nature. It is found only in combination, chiefly with oxygen, forming silicon dioxide, or silica, which combined with bases makes up the larger part of the rock-crust of the globe. Also called *silicium*.—**Silicon-brass**, brass prepared with the addition of a small amount of silicon, by which its valuable qualities are said to be improved.—**Silicon-bronze**, copper prepared with the addition of a small amount of silicon-copper, by which its valuable properties for certain uses, as for telegraph-wire, are said to be considerably improved. Weiller's silicon-bronze telegraph-wire was found by analysis to consist of almost chemically pure copper, with 0.02 per cent. of silicon. The silicon-bronze telephone-wire of the same maker contained 1.02 per cent. of zinc, 1.14 of tin, and 0.05 of silicon. The addition of the silicon in the manufacture of silicon-bronze seems to have no other effect than that of entirely removing the oxygen of the copper.—**Silicon-iron**, iron containing a large proportion of silicon (as much, in some instances, as 10 to 14 per cent.), prepared for use in improving the quality of cast-iron, especially for foundry use,

which it is now believed to do by its action on the carbon which the iron contains, an increase of silicon changing combined carbon to graphitic, and vice versa. Also called *high-silicon iron*, and, of late more generally, *ferro-silicon*.

"When the founder understands its [silicon's] use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." (Kepp and Orton, Trans. Amer. Inst. Min. Eng. (1888-9), XVII, 253.)—**Silicon ware**, a kind of stoneware introduced about 1883 by the Lambeth potteries: it is colored in the body, very slightly glazed, and somewhat resembles Wedgwood ware in surface and coloring.

The Chinese name for silk is *szé*, *szú*, *sz'*, with variants *sei*, *si*, whence *Corean sa*, *sil*, *sir*, *Mongol sereg*, *silk*, < *se* (< Chinese *szé*, *sa*) + *-reg*, a suffix of Tatar languages. The Chinese word is prob. not connected with the European, except that the *Gr. Σῆρες* may mean the Chinese, and be based on the Chinese name for silk. For the more common Teut. word for 'silk,' see *say*.] 1. *n.* 1. A fine soft thread produced chiefly by the larvæ of various bombycid moths, especially of *Bombyx* (*Sericaria*) *mori*, known as *silkworms*, feeding on the leaves of the mulberry and several other trees. (See *Bombyx* and *silkworm*, and compare *gut*, 4.) *silk* is the strongest, most lustrous, and most valuable of textile fibers. The thread is composed of several finer threads drawn by the worm from two large organs or glands containing a viscid substance, which extend, as in other coon-making caterpillars, along a great part of the body and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming its cocoon. *Raw silk* is produced by the operation of winding off at the same time several of these cocoons, after they have been immersed in hot water to soften the natural gum on the filament, on a common reel, thereby forming one smooth, even thread. Before it is fit for weaving it is converted into one of three forms, namely *singles*, *tram*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together, and is commonly used in weaving as the *shoot* or *wef*. (For *organzine*, see *throw* *silk*, below.) *Silk* of various qualities (but none fully equal to the preceding) is produced by different genera of the family *Saturniidae*, particularly the tussar-worm of India, *Attacus mylitta*, the yama-mai of Japan, *Antheraea yama-mai*, etc., feeding on the oak and other plants. 2. A similar thread or fiber spun by various other insects, especially some spiders; a kind of cobweb or gossamer. Some such webs are lustrous, and may be reeled like true silk. See *Nephila*, and cut under *silk-spider*.—3. Cloth made of silk; by extension, a garment made of such cloth. In this sense the word has a plural, *silks*, denoting different sorts or varieties: as, *black silk*; *white silk*; *colored silks*.

II. n. A name given by Murchison, in 1835, to a series of rocks the order of succession of which was first worked out by him in that part of England and Wales which was formerly inhabited by the Silures. The various groups of fossiliferous rocks included in the Silurian had, previous to Murchison's labors, been classed together as one assemblage, and called by the Germans *grauwacke*, sometimes Anglicized into *graywacke* (which see), also the *Transition series* or *Transition limestone*. In England and Germany these lower rocks have been greatly disturbed and metamorphosed, and have also been frequently invaded by eruptive masses; hence it was not until after considerable progress had been made toward a knowledge of the sequence of the higher fossiliferous groups that the lower (now designated as *Silurian* and *Devonian*) began to be studied with success. Almost contemporaneously with the working out of the order of succession of these lower rocks by Murchison in Great Britain, groups of strata of the same geological age, but lying for the most part in almost entirely undisturbed position, began to be investigated on and near the Atlantic coast of the United States, especially in New York, by the Geological Survey of that State, and a little later in Bohemia by Joachim Barrande. Murchison, Barrande, and James Hall, paleontologist of the New York Survey, are all agreed as to the adoption of the name *Silurian*, and in regard to the essential unity of the series or system thus designated. The Silurian is the lowest of the four great subdivisions of the Paleozoic, namely

Silurian, Devonian, Carboniferous, and Permian. When undisturbed and unmetamorphosed, the Silurian is usually found to be replete with the remains of organic forms, of which by far the larger part is marine. The Silurian is divided into an Upper and a Lower Silurian, and each of these again is subdivided into groups and subgroups varying in nomenclature in various countries. The line between the Upper and Lower Silurian is drawn in Great Britain at the top of the May Hill sandstone or Upper Llandovery group; in New York, at the top of the Hudson River or Cincinnati group. The almost entire absence of vertebrates and of land-plants, and the paucity of plant-life in general, are the most striking features of Silurian life. The most prominent forms of the animal kingdom were the graptolites, trilobites, and brachiopods, and of these the first-mentioned are the most characteristic of all, since they range through nearly the whole Silurian, and disappear in the Devonian; while the trilobites, which begin at the same time with the graptolites, continue through the Devonian, and end only with the Carboniferous. As the line between the Silurian and Devonian is commonly drawn in England—namely, so as to include in the former the Ludlow group—the first vertebrates, in the form of a low type of fishes, appear near the top of the Upper Silurian; traces of land-animals (scorpions) have also been found in the Upper Silurian of Sweden and Scotland; and in France, in the Lower Silurian, traces of insect life. A scorpion has also been found in the United States, at Waterville, New York, in the Waterlime group, or near the middle of the Upper Silurian. Mr. Whitfield, by whom the specimen was described, inclines to the opinion that the species, for which he instituted a new genus (*Proscorpius*), was aquatic and not air-breathing, and that it forms a link between the true aquatic forms like *Eurypterus* and *Pterygotus* and the true air-breathing scorpions of subsequent periods. He intimates that the same is likely to be true of the Swedish and Scottish Silurian scorpions. The traces of land-plants in the Silurian are rare, and for the most part of doubtful identification. Algae, on the other hand, are of somewhat frequent occurrence. As the line between Silurian and Devonian is drawn in the United States—namely, between the Oriskany sandstone and the Cauda-galli grit—there are neither land-animals nor fishes in the Silurian; and the evidence of the existence of land-plants lower than the Devonian is for the most part of a very doubtful character. The Silurian rocks are widely spread over the globe, with everywhere essentially the same types of animal life. This part of the series is of importance in the United States, especially in the northeastern Atlantic States and in parts of the Mississippi valley.

silurid (si-lū'rid), *a.* and *n.* Same as *siluroid*.

Siluridae (si-lū'ri-dē), *n. pl.* [NL., *< Silurus* + *-idae*.] A very large family of physostomous fishes, of the order *Nematognathi*, represented by such forms as the sheat-fish of Europe and the catfishes or cats of America. It was the same as *Silurides* of Cuvier. By Cope its name was used for *Nematognathi* with the anterior vertebra regularly modified, the inferior pharyngeal bones separate, and an operculum developed. It thus contrasted with the *Aspredinidae* and *Hypophthalmidae*, and included all the *Nematognathi* except those belonging to the two families named. By Gill the family was restricted to those *Nematognathi* which have the anterior vertebra regularly modified; the lower pharyngeal bones separate; the operculum developed; a dorsal fin, in connection with the abdominal portion of the vertebral column, rather short, and preceded by the spine; the pectoral fins armed with well-developed spines having a complex articulation with the shoulder-girdle; and the body naked, or with plates only along the lateral line. The lower jaw has no reflected lip, and there are usually from four to eight pairs of barbels, maxillary barbels being always developed. Species of the family thus limited are very numerous, several hundred having been described, and referred to many genera. Most of them inhabit fresh water, especially of tropical and subtropical countries, but many are also found in tropical seas. In Europe, one, the sheat-fish, *Silurus glanis*, oc-

urs in the central and eastern regions of the continent; while a second, more southerly, and supposed to be the *glanis* of the ancients, has lately (1890) been distinguished as *Silurus (Parasilurus) aristoides*. In North America the family is represented by a number of species belonging to different subfamilies, which are generally known under the name of *catfishes*. The leading genera of North America are *Noturus*, stone-cats; *Ameiurus*, ordinary cats, pouls, bullheads, etc.; *Ictalurus*, channel-cats; *Arius*, sea-cats; and *Etheichthys* (or *Felichthys*), gaff-top-sails. See also cuts under *catfish*, *gaff-top-sail*, *pout*, and *stone-cat*.

He is usually represented with a sickle in his right hand and a bough in his left, and is described as the protector of herds from wolves and of trees from lightning, and a patron of agriculture in general, and as the defender of boundaries.

2. [NL. (Latreille, 1807).] A genus of clavicorn beetles, of the family *Cucujidae*, consisting of small, slender species with five-jointed tarsi in both sexes, the fourth joint very small, and antennal joints from nine to eleven, abruptly enlarged. Some attempt to connect *silver* with *L. sulfur*, sulphur (see *sulphur*), others with Gr. *σίδηρος*, iron.] I. *n.* 1. Chemical symbol, Ag; atomic weight, 107.9. A metal of a white color, having a specific gravity of 10.4 to 10.7 (according as it is cast, rolled, or hammered), harder than gold, and softer than copper, having a tenacity about equal to that of gold, and melting at a temperature a little lower than copper. Its whiteness is remarkable, that of tin alone among the common metals nearly approaching it; among the rare metals, indium and lithium are equal to silver in color and luster. Silver crystallizes in the regular (isometric) system; but, although native silver is of frequent occurrence, distinct crystals are very rare. Arborescent and filiform shapes are most common, but very large solid masses have been found. Silver occurs in a great variety of ores, being mineralized by sulphur, antimony, and arsenic, as well as by chlorine, iodine, and bromine. These ores are widely distributed over the world. Silver is very commonly associated with lead; and the common ore of the latter metal, galena, always contains some silver, and generally enough to make its separation remunerative. Silver has also been detected in the water of the ocean. The principal silver-producing regions are the Andes and Cordilleras. From Peru and Bolivia came an immense supply of this metal during the sixteenth and seventeenth centuries. Mexico has been a large producer of silver since the middle of the sixteenth century. The mines of the Comstock lode at Virginia City, Nevada, produced about \$320,000,000 worth of bullion from 1860 to 1890, about five twelfths of the value of which was silver. This metal has always been accounted "precious," and has been used for ornament and as a measure of value from the earliest times of which there is any historical record. Its most marked point of inferiority to gold, apart from color, is its liability to tarnish when exposed to sulphurous emanations or brought into contact with anything containing sulphur. Silver is too soft to be used in the unalloyed condition. The ratio of silver to copper in the free coinage of England is 92½ to 7½ (or 12½ to 1); in that of France and the United States, 9 to 1; and in that of Prussia, 3 to 1. The world's production of silver, estimated in dollars (at the coinage rate of \$1.2929 per ounce), has increased from \$89,000,000 in 1879 to \$216,000,000 in 1894. In the United States the production increased from \$41,000,000 in 1879 to \$82,000,000 in 1892. In 1893 it was \$77,000,000, in 1894 \$64,000,000, in 1895 about \$60,000,000, and in 1896 about \$70,000,000. From the foundation of the government until 1873, when the free coinage of

silver was stopped (see *coinage ratio, dollar*), about \$8,000,000 were coined. Under the silver-purchase acts of 1873 and 1890 over \$300,000,000 have been coined, but only about \$60,000,000 are in circulation. (See *silver certificate*, below.) The total amount of silver purchased by the government from Feb. 12, 1873, to Nov. 1, 1893 (when the purchase act of 1890 was repealed), was 496,984,889 ounces, at a cost of \$608,933,975. Political agitation for the resumption of the free coinage of silver at the existing ratio (about 16 to 1) has been carried on vigorously in the West and South since about 1873; and in 1896 the Democratic party made this the chief plank in its platform, and was defeated on this issue.

German silver, a white alloy of copper, zinc, and nickel, used as a cheap substitute for silver, and as a superior article for plated ware, being covered with silver by plating as is the cheaper Britannia metal. The relative proportions of the metals in the alloy called German silver vary considerably, according to the desire of the manufacturer to produce a cheaper or more expensive article. The commonest kind contains about eight parts of copper, two of nickel, and three to five of zinc. A finer kind of alloy is obtained by adding more nickel; the metal is then less liable to tarnish, and the resemblance to silver in color and luster is more striking. Nickel is a much more expensive metal than copper, and very much more so than zinc. See *nickel*.—**King's silver**. (a) A name given to silver used in England from about 1700 to 1720 for plate of an unusually high standard: apparently introduced by workmen from the continent, and abandoned because not sufficiently hard and durable. It is a native of the mountains of central and southern Europe, planted elsewhere. It grows from 80 to 120 or even 200 feet high. Its timber is soft, tough, and elastic, of a creamy-white color, useful for many building and cabinet purposes, for making the sounding-boards of musical

instruments, toys, etc. It yields resin, tar, and the Strasburg turpentine. This is the "noble fir" (*edler Tannenbaum*) of the Germans. The silver fir of the Alleghany region, etc., is *A. balsamea*, mostly called *balsam* or *balm of Gilead*, etc. It is a moderate-sized tree, its twigs sought for scented cushions, its bark secreting Canada balsam (see *balsam*), also the source of spruce-gum. Pacific North America presents several noble silver firs, as *A. grandis*, the white fir of Oregon bottom-lands, and *A. nobilis* and *A. magnifica*, the red firs of the mountains of Oregon and California, all trees between 200 and 300 feet in height.—**Silver fox**, the common red fox, *Vulpes fulvus*, in a melanistic variation, in which the pelage is black or blackish, overlaid with hoary or silver-gray ends of the longer hairs. It is an extreme case of the range of variation from the normal color, of which the cross-fox is one stage. It occurs in the red foxes of both America and Europe, especially in high latitudes, and constitutes the *Canis* or *Vulpes argentatus* or *argenteus* of various authors. The silver fox has sometimes been defined wrongly as a variety of the gray fox of the United States (*Urocyon cinereo-argenteus*), perhaps by some misapprehension of Schreber's (1778) specific name, just cited; but this is a distinct species of a different genus, and one in which the silver-black variation is not known to occur. Compare cut under *cross-fox*.

While the Cross and Black and Silver Foxes are usually considered as different varieties, they are not such in the classificatory sense of that term, any more than are the red, black, or white wolves, the black marmosets, squirrels, etc. The proof of this is in the fact that one or both of the "varieties" occur in the same litter of whelps from normally colored parents. They have no special distribution, although, on the whole, both kinds are rather northerly than otherwise, the *Silver Fox* especially so. Coues and Yarrow, Wheeler's Expl. West of the 100th Meridian, V. 53.

There be three degrees of this hiding and veiling of a man's self: the first, closeness, reservation, and secrecy; . . . the second, dissimulation in the negative—when a man lets fall signs and arguments that he is not that he is; and the third, *simulation* in the affirmative—when a man industriously and expressly feigns and pretends to be that he is not.

The *simulation* of nature, as distinguished from the actual reproduction of nature, is the peculiar province of stage art.

Scribner's Mag., IV. 438.

2. Specifically—(a) In *phonology*, imitation in form; the alteration of the form of a word so as to approach or agree with that of another word having some accidental similarity, and to suggest a connection between them: a tendency of popular etymology. (b) In *biol.*, unconscious imitation or protective mimicry; assimilation in appearance.—**3.** Resemblance; similarity. [Rare.]

'being (so)' (see *sooth*), Goth. *sunja*, the truth, sooth.] **1.** Any want of conformity unto or transgression of the law of God. (*Westminster Assembly's Shorter Catechism*.) The true definition of sin is a much contested question, theologians being broadly divided into two schools of thought, the one holding that all sin consists in the voluntary and conscious act of the individual, the other that it also includes the moral character and disposition of the race: one that all moral responsibility is individual, the other that there is also a moral responsibility of the race as a race. To these should be added a third school, which regards sin as simply an imperfection and immaturity, and therefore requiring for remedy principally a healthful development under favorable conditions. Theologians also divide sin into two classes, *actual sin* and *original sin*. Actual sin consists in the voluntary conscious act of the individual. (See *actual*.) Original sin is the innate depravity and corruption of the nature common to all mankind. But whether this native depravity is properly called *sin*, or whether it is only a tendency to sin and becomes sin only when it is yielded to by the conscious voluntary act of the individual, is a question upon which theologians differ. Roman Catholic and other theologians, following the early church fathers, distinguish between *mortal* (or *deadly*) and *venial* sins. Mortal or deadly sins are such as wilfully violate the divine law, destroy the friendship of God, and cause the death of the soul. The seven mortal or deadly sins are pride, covetousness, lust, anger, gluttony, envy, and sloth. Venial sins are such transgressions as are due to inadvertence, do not destroy the friendship of God, and, while tending to become mortal, are not in themselves the death of the soul. The difference is one of degree, not of kind.

And ye knowe also that it was do be me, and so sholde myn be the *synne*.

2. In *trigon.*, formerly, with reference to any arc of a circle, the line drawn from one extremity of the arc at right angles to the diameter which passes through its other extremity; now ordinarily, with reference not to the arc but to the angle which it subtends at the center of the circle, the ratio of the aforesaid line to the radius of the circle.

Thus, in the diagram, BE is the sine of the arc AB (sometimes it is defined as half the chord of double the arc), and the ratio of BE to CB is the sine of the angle ACB. (See *trigonometrical functions*, under *trigonometrical*.) A more scientific definition of

the sine is that of Euler, $\sin x = \frac{1}{i}(e^{-ix} - e^{ix})$, where $i^2 = -1$, and e is the Napierian base. The sine is also fully defined by the infinite series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$

But all the properties of sines are readily deduced from the definition that the sine is such a function that it vanishes with the variable, while

$$\frac{d \sin x}{dx} = \sqrt{1 - (\sin x)^2}.$$

Same as *supplemental versed sine*.—**Supplemental versed sine**, the difference between the versed sine and the diameter.—**Versed sine**, unity minus the cosine. Formerly, for the arc AB (see the diagram), it was understood to be the line EA: now the ratio of EA to BC is the versed sine of the angle ACB.—**Whole sine of a circle**, the radius.

The usage is said to have originated in a mistaken interpretation of Hosea iv. 8: "They eat up the sin of my people."

The manner [in the County of Hereford] was that, when the Corps was brought out of the house and layd on the Bier, a Loafe of bread was brought out, and delivered to the *Sine-eater* over the corps, as also a Mazar-bowl of maple (Gossips bowle) full of beer, wch he was to drinke up, and sixpence in money, in consideration whereof he tooke upon him (ipso facto) all the Sinnes of the Defunct, and freed him (or her) from walking after they were dead.

The liquid then rises by the pressure of the atmosphere and fills the tube, and the flow

begins from the lower end. Sometimes an exhausting-tube (*a* in the figure) is placed on the longer leg; the air, in that case, is sucked out through *a* till the tube is filled to the cock *b*, which is then opened, and the flow commences—the cock *b* being so constructed as to close the suction-tube when the siphon is running. But the more general method is to fill the tube in the first place with the liquid, and then, stopping the mouth of the longer leg, to insert the shorter leg in the vessel; upon removal of the stop, the liquid will immediately begin to run. The flow depends upon the difference in vertical height of the two columns of the liquid, measured respectively from the bend of the tube to the level of the water in the vessel and to the open end of the tube. The flow ceases as soon as, by the lowering of the level in the vessel, these columns become of equal height, or when this level descends to the end of the shorter leg. The atmospheric pressure is essential to support the column of liquid from the vessel up to the top of the bend of the tube, and this height is consequently limited, varying inversely with the density of the liquid. At sea-level the maximum height is a little less than 30 inches for mercury and 34 feet for water.

It conveys water, and is of various shape and size, sometimes several times longer than the rest of the animal when fully extended, but usually capable of being withdrawn into the shell. In *Teredo* the united siphons are so long that the mollusk resembles a worm. See cuts under *ship-worm*, *Teredo*, *quahog*, and *Mya*. (2) A similar siphon in some gastropods, extending from the anterior portion of the mantle over the head. See cut under *Siphonostoma*, 2. See *siphuncle*. (4) A tubular or canaliculate formation of the shell of any mollusk which covers or protects the soft siphon; especially, the siphuncle of a cephalopod, or the communication between the compartments of the shell. The fresh-molted plumage in life is a lovely green, but has the tendency of soon changing to a veridical blue, as it does also in stuffed specimens, particularly if exposed to the light. This green or blue is varied with a black fillet encircling the head, with white tips and black subterminal bars on the tail-feathers and inner quill-feathers, and with bright sanguine red on the wings, which easily fades to a dull reddish-brown. During its prevalence the sky is covered with a dense haze, persons suffer from extreme lassitude, and vegetation is parched and burned. No month is free from it, but it is most frequent in the spring. Its direction varies from southeast to southwest.

There are 6 species, including the genus *Berula* (Koch, 1837), separated from *Sium* by some on account of its nearly globose fruit with inconspicuous ribs and thick corky pericarp. They are natives mostly of the northern hemisphere, with one in South Africa, all growing chiefly in watery places. They are smooth herbs bearing once-pinnate leaves with toothed leaflets, and white flowers in terminal or lateral compound umbels with many-bracted involucre and involucres. They are known as *water-parsnip*. Two species occur in the eastern United States—*S. cicutaefolium* and *S. Carsonii*—besides *Berula angustifolia*, by many referred here. Compare *nina*, and for *S. Helenium* see *jeltico*. See cuts under *inflorescence* and *skirret*.

Minsheu, Guide into Tongues (1617).

3. Hence, in university use, a charge made for an extra portion of food or drink; a farthing, as the former price of each portion. The word was also used more generally, to note any additional expense incurred.

We speak of the *magnitude* of a calamity or of a fortune, the *bulk* of a bale of cotton or of an elephant, the *volume* of smoke or of an avalanche.
